#### ABSTRACT

Millennium Construction initiates a plan to improve the computerized based Cost Engineering System operation to be more fully automated and well integrated with all interdependent parts in access and under control. Cost Engineering tasks include monitoring and measuring cost status, converting raw data to accurate information for cost analysis and reporting, application and limitations of variances for exception reporting, forecasting and trending procedures in construction project. Information on project schedule and procurement plan, actual work progress is also required. These information resources, much in extent, need to be stored in database files to reduce redundancy and provide easier access. In existing stand alone computer environment, information are scattered in several computer units with different data definitions and making it difficult to integrate when needed. Database management system (DBMS) will be used to keep the information in common standard so that these files can be shared among several users. The electronic routing by linking PCs under distributed client/sever network will allow efficient communication among cost-related d<sub>a</sub>ta components and reduce tenuous jobs of paper shooting.

The proposed system is expected to minimize inaccuracy, invalidity and missing in data input process. The system development costs will be recovered by the costsaving and cost-avoidance benefits within 4 years after implementation. The benefits also include the improved service level and improved information which are not interpreted into monetary value but can be perceived by the users and the management.

i

#### ACKNOWLEDGEMENTS

The writer would like to thank his advisor, Air Marshal Dr. Chulit Meesajjee for his guidance and suggestions for the completion of this project. He is grateful to his boss at Italian-Thai Development PLC., Khun Pongwudh Wannasai for his continuous support and encouragement since he first studied in CIS program until his graduation. Thanks to his colleagues and friends for their help and support. Finally, a great deal of appreciation is given to his parents, brother, and sister for their constant encouragement that keeps him with untiring efforts to accomplish this project.

#### I. INTRODUCTION

#### **1.1** Background of the Project

Cost Engineering System provides analytical methods and procedures for monitoring, analyzing, forecasting and controlling the costs on construction project to meet timely and profitable completion. Its concepts can be applied from conceptual planning, through engineering and design, to construction and start-up. As the word "engineering" implies, understanding of plans and specifications and technical aspects of construction works are required as information sources for monitoring, reporting cost and forecasting trend properly.

The system makes use of information which are results of the interface between management, line supervisor, scheduling, procurement, accounting and field engineers. The Cost Engineering activities include consideration of non-linearity in monitoring and measuring cost status, converting raw data to accurate information for analysis and reporting, the application and limitations of variances for exception reporting, forecasting and trending procedures and the appropriate application or abstaining from corrective action.

Cost Engineering System, though connected to the company's accounting systems through a database, is deliberately oriented towards the needs of company and project management. The distinctions are, the system applies principles of engineering economy to include the time value of money in project decision making, and integrate, with schedule through database, for cash-flow forecasting. The important thing is to handle these extensive data in such a way that they are always available in timely manners and can be shared among several computers and departments. Computer network with interactive applications of database management software is necessary for the improvement of the system. Information communication among several departments in paper document will be converted into electronic form.

#### 1.2 Objectives

This project is to set up distributed database management system for Cost Engineering System and develop centralized computerized information system with a network linking computer system of several departments. It is aimed to provide accurate, timely and current information in the following areas:

- set up a standard format for cost-related data keeping by using conventional "cost code"

- reduce time required in preparing cost-related reports

- reduce errors and discrepancy of the same data kept in and handled by several departments

- reduce cost of system output by eliminating duplicate or unnecessary reports

- integrate the cost-related data from several sources

- speed up input, since shared database allows direct update by the authorized data source departments

#### 1.3 Scope

This Cost Engineering System project deals with the study of existing working system, analyzes system problems and initiates improvements of existing computer systems. The scope of this project includes:

- Studying the work flow of the system, its input and output requirements and database system for the information management.

- Set up standard working procedures from existing operation and documentation to suit computerized working environment.

- Set up of computerized database system by using distributed client-server network. This database system can be shared among several users and departments involved in cost-related information e.g. Planning, Construction, Procurement and Accounting & Finance.

- Develop input and output screen in form of graphical user interface to provide easy and friendly environment.

- Develop query function of database management system that can promptly generate cost-related reports with related "fields" to be furnished according to specific purpose.

ABAC GRADITATE COMON, LIRA

#### **II. EXISTING SYSTEM**

#### 2.1 Background of the Organization

Millennium Construction is an engineering and construction company set up in 1979 by 2 civil engineers during their successful entrepreneurship in a housing project and with anticipation of long-term prospects of construction industry in Thailand.

During the 20 years of expansion, Millennium Corporation has developed itself to handle several disciplines of design and construction works, especially roads, residential buildings, commercial buildings, industrial plants, bridges and transportation systems. Millennium always emphasizes in quality of workmanship and materials and the adoption of latest technologies in construction together with the commitment to deliver the project on time.

Millennium' achievements in meeting the needs of customers and community through technical excellence have been proven by the increasing number of customers over the recent years. Millennium continually provides services to Thai government organization, private sector organization and property developers. With awareness of the importance of the development in civil engineering and construction industry in Thailand, Millennium is always open to adopt and implement the use of new technologies to assist and support the work in construction sites and in office operations. In terms of computer technology, Millennium has set up a Computer System Department to support and take care of all computer hardware and software and to manage the information system used within the company. Computer applications extensively used are CADs, project management and database management.

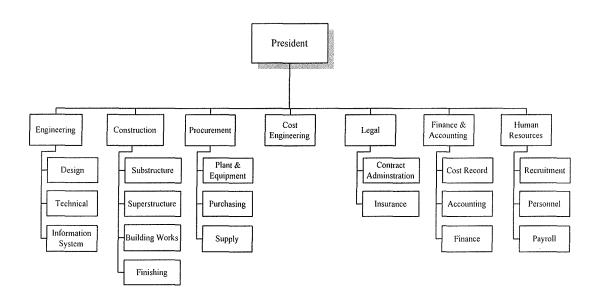

Figure 2.1. Organization Chart of Millennium Construction.

#### 2.2 Existing Business Function

Cost Engineering System

Cost Engineering Department is responsible for collection, measurement, quantification and analysis of construction project cost, work quantity, schedule and resources taking into account technical and engineering point of view in parallel with commercial and economical factors. The system provides cost-related information on working method, equipment, material and manpower of construction activities used by project management and operation within optimum cost while still maintaining the good quality of work and meeting project schedule. Apart from internal project information from Design and Construction Departments e.g. drawings, design specifications, Cost Engineering also requires external information such as inflation rates, construction cost indexes, bid price indexes for construction activities, labour and materials in conducting analysis and developing reports. For construction and technical purposes, Cost Engineering System provides information about the cost-effective construction methods or techniques. For procurement management, the system helps indicate the plan to procure materials, equipment and manpower. For financial management, it develops forecast cash flow report from construction plan and progress.

The Cost Engineering information system requires a large amount of data processing and periodical data updating. Since the system needs to integrate information from various sources, on-line network computing system with distributed databases will be set up to provide effective data handling and manipulation. The data will be stored at several locations throughout the network with the master file managed and controlled by Cost Engineering. These databases allow convenient update from several data providers. They are also useful in preparing various kinds of management reports responding to different purposes and used as reference to develop pricing document for new project bidding or tendering.

Overall cost controls

Overall cost controls should be integrated with schedule controls. They include the following:

- Preliminary estimates
- Detailed cost estimates
- Definitive estimates
- Cost report summary
- Value-engineering studies
- Field cost controls
- Other significant data (management reports)

ABAC GRADUATE SCHOOL LIBBART

#### **Preliminary Estimates**

Preliminary estimates are the first check against the budget and can be used to indicate cost overruns early enough for project team to review the design for possible alternates. Since these are made prior to completion of detailed drawings, the margin of error and contingency applied is greater than for fair cost estimates, varying with the extent of design and cost information of the projects.

#### Fair-Cost Estimates

Fair-cost estimates are best prepared from the actual bid documents provided to bidders. They should be completed before receiving bids so that any discrepancies in plans and specifications, duplication in scope and possible value-engineering alternates can be figured out before bids are received. Information required are local conditions such as material price, wage rates, labour productivity.

#### **Definitive Estimates**

Definitive estimates fix the anticipated cost of project with little margin for error. Contingency, when the contract has been awarded, is generally limited to providing for plan changes due to interference or error, omissions or conflicts, or for other unanticipated risks in the project. Several numerical and statistical methods are applied for forecasting total cost underruns or overruns at various contract award percentages. Summary Cost Report

Summary cost report describes the actual and forecast status of the project. It commences with preliminary estimate and end when the project is complete. Cost reports showing estimated cost-at-completion can be prepared from the committed cost plus estimated cost-to-complete. Continual cash-flow projections can be also prepared to accompany the cost reports.

#### Value Engineering Report

Value engineering studies help in determining the most economical approach prior to detailed design. One approach is application of construction cost knowledge during design and consideration of alternates proposed. The report shows value-engineering savings keeping the results in focus and can be of long term benefit on future projects. Field Cost Controls

Overall cost control can be developed either at the job site or in office. Itemized breakdown by labour, materials and work quantity for all changes is required in order that adjustment of contract price can be indicated. Preparation of detailed estimate based upon quantity takeoff by field construction manager can pinpoint the differences.

Cost Engineering System provides the following deliverables:

- Work Breakdown Structure
- Cost Code
- Project Budget Report
- Resource Schedule
- Summary Cost Report
- Cash Flow Report

Work breakdown structure

Work breakdown structure is common numbering system used to describe work element of a project in logical hierarchy for management control activities. It is applied at various levels to structure both and schedule planning and reporting. It can also indicate individual or departmental responsibility and accountability, organize drawings

and specifications and other applications. The structure identifies both cost and schedule parameters at various levels of details.

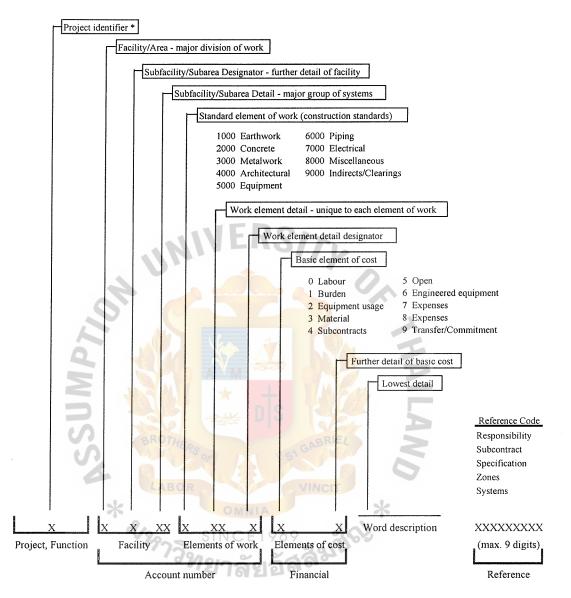

Work breakdown structure describes the work elements of a project in a logical hierarchy which can be used for a number of related management control activities. Integrated management control systems are designed to reflect the interdependence upon cost, schedule and other parameters.

With the use of computer, full detail can be made at lower levels and fully consistent summary information can be distributed up the management levels.

#### Work Breakdown Structure for a Major Project

\* Project identifier is optional, used only on multiproject program.

Figure 2.2. Work Breakdown Structure for Construction Project.

#### Cost Code

Cost code is standard numbering and classifying system used as structural discipline for uniformity, transfer and comparison of information for project cost control. Millennium's Cost Engineering System uses CSI's Masterformat, which is

1145 C.1

ABAC

GRADUATE SCHOOL LIBRARY

published by the Construction Specification Institute of USA and primarily designed for building construction, in developing cost code. Details are shown in Appendix I. Types of Cost Codes

- Standard cost code

Standard cost code is classification and categorization of all items of works pertaining to particular type of work. There may be different standard codes for different types of work.

Examples of different types of work that might each have its own standard cost code are the following:

- General building construction (offices, schools, warehouses, etc.)

- Heavy engineering projects (dams, hydroelectric plant, etc.)

- Process plants (oil refineries, petrochemical plants, etc.)

In developing standard cost code, first create exhaustive check list of all the items that might be found in its generic type of construction.

- Project cost code

Project cost code is classification and categorization of all items of work or cost pertaining to a particular project. It should be derived from the standard cost code so that different projects can be compared and the information can be maintained for estimating purposes. Project code may be prepared as soon as the project is authorized so that costs can be accurately distributed from the beginning.

Developing Project Cost Code (See Figure 2.3 and 2.4)

The item code taken from standard cost code becomes one part of code for typical project code item: "work type code".

In addition, add "project number", "area-facility code" and "distribution code" to form complete code for particular item in the project code.

- Project Number

The project number identifies the costs collected for this code specifically with particular project. It consists of the year the project starts (two final digits), type of the project, type of contract, the sequence with other projects start that year.

- Area Facility Code

The area facility code identifies geographic and physical features that logically separate one part of the project from another. Major breakdown is referred to as "area". Logical subdivisions within each area are referred to as "facility".

The area facility code helps keep track of costs in different areas, and it can isolate the costs attributable to different divisions of works in project.

- Work-Type Code

The work-type code is the part that is based on the "standard cost code".

- Distribution Code

The distribution code break out the resource components of various types of work, separating out the labour, materials, equipment and subcontract costs.

"1" is labour, "2" is material, "3" is equipment and "4" is subcontracts, etc.

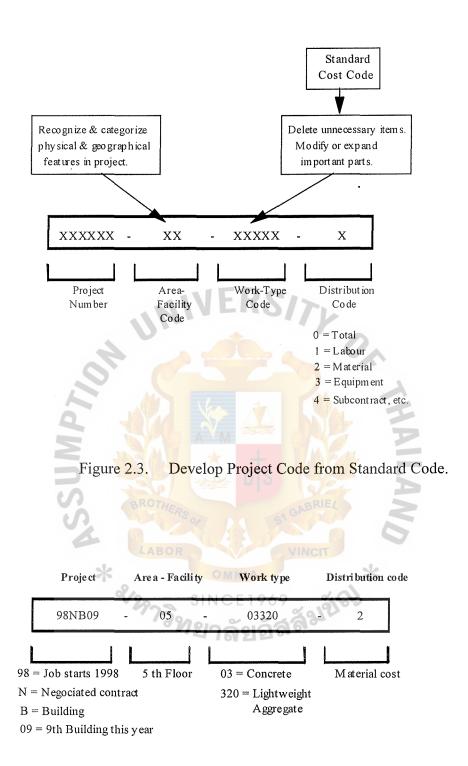

Figure 2.4. Example of Project Code.

Account Hierarchy

Account hierarchy is used to reflect level of detail in cost code. Terminology used includes:

#### Prime Account

The highest level of enumeration in cost code. For example, in the Masterformat, the first two digits of each code: "concrete" is represented by prime account "03".

Subaccount

Subdivision of greater detail within prime account.

#### Application of Account Hierarchy

Level of detail of code can be set at the level appropriate to scope of work represented. For major part of the project work, it is necessary to collect the costs of work into smallest details by breaking the cost down into several levels. While in minor part of the structure, only the costs at prime account level is enough.

The account hierarchy is also useful for tuning the level of detail of reporting to appropriate levels of management, according to the extent of each cost item in particular project.

Account hierarchy can help in preparing summary reports, exception reports and other techniques for getting the right information at the appropriate level of detail to the right person for decision in time for corrective action.

Project Budget Report

Project budget report is used as basic standard for monitoring and controlling cost status on a project. The structure of project budget is project cost code. Its standards for reference are derived from the cost estimate and include the quantities associated with ABAC GRADUATE SCHOOL LIBRE

each item of work in the code. It makes provision for recording and reporting the following:

- Actual performance
- Projections or forecasts to completion
- Variances in absolute and/or relative terms
- Reasons or conditions associated with excessive variances

#### Resource Schedule

Resource schedule provides information on the extent of resources required for project during all construction phases according to construction schedule. These resources are manpower, materials and equipment. The schedule is used by Procurement Department to set forth plan in purchasing the supply of project resources. The schedule helps in identifying the need of each resource at any construction phase, quantifying the elements needed and preparation of procurement specifications. It is used to determine the right time to procure resources in different periods of project in the most economical manner.

Summary Cost Report

Summary cost report provides actual and forecast cost status of the project. The report comes in several forms and generally commences with preliminary estimate and end when the project is complete and all claims, if any, have been settled. Cost reports have been developed and updated, usually in monthly basis.

#### Cash Flow Report

Cash flow report is used for project financial planning and control by Accounting & Finance Department and management. The report gives gross cash requirements for expensed throughout the project and also determine working capital requirements for

the company and in setting lines of credit to borrow funds at appropriate time and favorable rate. Cash flow reports are regularly prepared to accompany summary cost reports

#### Sources of Data for Cost Control

Cost control system requires good data for materials, equipment and labour. Main sources of these data are:

- Labour and equipment time sheets.
- Field surveys of quantity of work in place.
- Other information for forecasting cost trends.
- Data from other control systems e.g. scheduling, procurement, quality assurance.

Measuring and Reporting Work Quantity

Estimate and measure quantity of elementary work items accomplished during that period. Quantity report should be mixture of actual measurement and judgment estimate. Use projections based on past production rates.

Once the quantity data are combined with the expenditure of labour, equipment and material resources, one can compute unit cost, study learning curve improvement, make projections of cost completion.

#### 2.3 Current Problems and Areas for Improvements

Like any task in handling routine, transaction-based data of massive extent, Cost Engineering System suffers the problems of data updating and storing. Since the system makes use of data which are from several sources i.e. Planning Department, Construction and Accounting & Finance Departments, it is difficult to catch up with all frequently changed cost-related data. Therefore problems of consistency, validity and redundancy of data are usually encountered.

16

The computers used in these departments are all individual and separate. The format of data keeping and reporting are varied. These departments, while all requiring cost-related data, keep the same piece of information individually. The data update need to be printed out and distributed among departments. Each department then need to update or key-in such data in its own computers. This situation has caused the risk of losing information and potential error in re-entering data. Also the unnecessary redo of data entering the redundancy of data storing in several files. The timeliness of data is also deteriorated under such practice.

The problems of current Cost Engineering System are:

- The error of information due to untimely data update.
- The report cannot be generated promptly at the time required.
- The discrepancy of the same information when cross-checking with report from Accounting & Finance Department.
- Data redundancy caused by keeping data in several computers.
- Reports for new projects need to be re-furnished, but it is not possible to be adopted from past project data.

Areas for improvements in Cost Engineering computerized system can be of 2 aspects:

#### 1. System Hardware

Computer network needs to be installed in order to link the computers of several work divisions. The information from each computers then can be shared with one another.

Current PCs used are still able to handle the processing requirements. Some additional hardware for network setting up needs to be purchased.

### 2. System Software

The system requires effective database management software to deal with massive data: to store, ease retrieving and help in furnishing reports of required fields and suit to purpose.

More details are stated in 3.3 Hardware and Software Requirements.

#### III. PROPOSED SYSTEM

#### 3.1 User Requirements

The current Cost Engineering System deals with cost-related data as dynamic information and should be promptly retrieved at any time required. Analysis has been conducted to figure out how to store, process and retrieve data in practical way. Data flow from one department to another. Database design is required to handle the large quantity of frequently changed cost-related data of Cost Engineering System. The application should assist in preparing full detail of Work Breakdown Structure at lower levels and developing fully consistent summary information to be distributed up the management level. When developing cost-related reports, the required information can be promptly retrieved and report format can be easily furnished. Control of data access and update should be added to provide adequate security and consistency of information. Following are the particulars from system users:

Cost engineer requirements:

- The application should assist in determining major group of activities in construction project and classifying cost items and consolidate these items to be the overall summary.

- The application should be able to generate the form of spreadsheet or table promptly to be used in newly identified cost items.

- The system should support the possible addition and deletion of cost items from conceptual planning stage through actual construction and up until the completion of project.

- The database management system used should discriminate the integrated single account of Work Breakdown Structure that identifies both the process

A		and an	
	ABAC		with the tr
GRADUATE	SCHOOL	LIBRADU	

code and the size or material code. Therefore the costs can be identified by size or material specification (for field installation control) and by process for comparison to initial budget (for schedule control).

- The system should support the conversion and redistribution of cost breakdown in bid estimate into appropriate project code categories. This is to use for project cost control, payment and progress purposes.

- The cost engineer requires for the computer network that gathers, organizes and disseminates cost information from Planning, Accounting & Finance, Procurement and Construction Departments.

Cost technician requirements:

- The cost technician requires for the input screen that is easy to key-in cost information i.e. cost code, work quantity, labour cost, material cost and amount.

- There should be control system for data input to verify key-entered data. For example, if character is found in number fields, error condition should be reported. Or the number keyed to processing falls below or above predefined range, warning message should be reported.

- There should be password in accessing information in Master Files to prevent unauthorized users.

#### 3.2 Systems Design

The Cost Engineering System extensively uses spreadsheet application to produce cost-related reports. The proposed system will add database management application to the existing application with full support of data transfer and maintaining some necessary calculation features. The computer screens are all GUI (graphical user interface) with user friendly interface using windows and mouse. Since the new DBMS is compatible with existing spreadsheet application, all cost-related reports will then be produced either from database application or from spreadsheet application, where some complicated calculation or special features to represent in multi-dimensional way is required.

System input and output documentation consists of headings and fields. Mostly numeric fields are used for cost-related data. The "cost code" field is alphanumeric, of which the length is predefined to prevent error in entering. Some alphabetic fields are used for written description of cost elements e.g. materials, equipment and labour and construction project description.

The system input has the same appearance as system output. Most are in form of tables and charts which usually link together.

The following controls are added to system input to ensure the correctness of data in key-entering:

- Numeric Test

To determine that the data keyed-in consist of numeric characters.

- Range Test

To determine whether the number keyed-in fall within the predefined range. The system input screens, output screens and examples of report are shown in Appendix G and H respectively.

As for the database design, relational database model is used because the Cost Engineering data rely much on the relationship of cost items and several summary reports can be simply developed by using relational operation e.g. SELECT, JOIN and PRODUCT. Its tabular representation is familiar and not a different conventional spreadsheet. Its flexibility in concatenating data from several sources also suits the purposes. Entity-relationship diagram of the database is shown in Appendix E. Processing files consist of 4 master files:

- 1. Estimate Cost Master
- 2. Work\_Structure\_Master
- 3. Control\_Budget\_Master
- 4. Actual\_Cost\_Master

Four transaction files are used for daily cost record for cost control purpose:

- 1. Material\_Transaction
- 2. Equipment\_Transaction
- 3. Labour Transaction
- 4. Indirect\_Cost\_Transaction

Summary files are also used to store summary record and management reports.

RSITYOX

In data processing, the computer program consists of following modules

Module 0: Cost Engineering System

Module 1.0: Develop Work Element List

Module 1.1: Get Project Information

Module 1.2: Get Cost Items

Module 1.3: Get Master format

Module 1.4: Develop Work Element List

Module 1.5: Write Work Element List

Module 2.0: Develop Work Breakdown Structure

Module 2.1: Determine Work Breakdown Structure

Module 2.2: Write Work Breakdown Structure

Module 3.0: Develop Cost Code

Module 3.1: Determine Cost Code

Module 3.2: Write Cost Code

Module 4.0: Prepare Project Budget Report

Module 4.1: Get Cost Estimate Summary

Module 4.2: Enter Cost Code

Module 4.3: Update Budget Cost

Module 4.4: Write Project Budget Report

Module 4.5: Print Project Budget Report

Module 5.0: Prepare Resource Schedule

Module 5.1: Determine Resource Schedule

Module 5.2: Write Resource Schedule

Module 5.2: Print Resource Schedule

Module 6.0: Prepare Summary Cost Report

Module 6.1: Prepare Actual Cost Summary

PILA/

Module 6.2: Write Summary Cost Report

Module 7.0: Prepare Cash Flow Report

Module 7.1:Prepare Cash Flow ForecastModule 7.2:Write Cash Flow Report

Module 7.3: Print Cash Flow Report

Structure Charts of these Modules are shown in Appendix D.

#### 3.3 Hardware and Software Requirements

The proposed Cost Engineering System requires computer network to link several PCs within department and also connect to computer system of other departments i.e. Planning, Accounting & Finance, Procurement and Construction.

Client/server computing is used to manage the network with all data management and storage put on server side and data processing on client machines.

TCP/IP is used as communications software to support distributed applications. This will allow the functions of the system split between client and server in such a way to optimize network resources. In the case of Cost Engineering System, most application logic is located at client side while the server is essentially maintaining the database. Interaction between the client and server or database accessing by client is done by using structured query language (SQL).

Graphical user interface (GUI) is used to facilitate the user interaction with the system. The presentation services modules on user screens are thus easy to use.

Figure 3.1 illustrates the LAN connection of all cost-related computer systems of the company. The server, as database server, will be located and controlled by Cost-Engineering Department. The network link computer system of 5 departments i.e. Cost-Engineering, Planning, Accounting & Finance, Construction and Procurement.

24

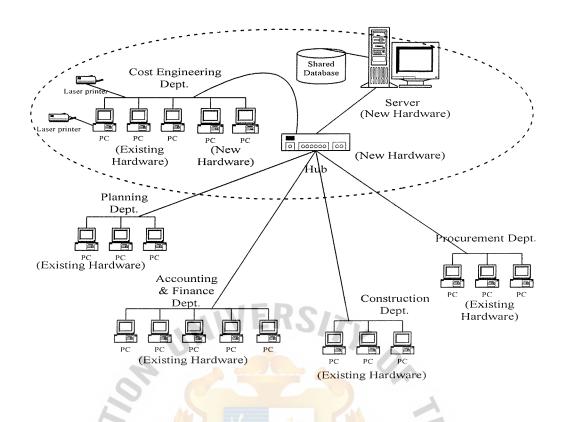

Figure 3.1. Computer Network System Diagram.

The proposed LAN system with one database server connecting to 5 client PCs of Cost Engineering System and other 14 PCs from several departments. The new hardware requirements are as follows: ลลัมยัต

1. Net Server 1 no.

specifications

- CPU Pentium III 500 MHz
- 64MB SDRAM memory
- 10 GB SCSI hard disk
- 7 mass storage shelves
  - 3 front accessible
  - 4 internal

- 15" SVGA monitor

- 2. Client PC 2 no. (for Cost Engineering Department)
  - CPU Pentium II 400 MHz
  - 512 KB cache
  - 32 MB SDRAM
  - 4.3 GB hard disk drive
  - 8MB Matrox MGA-G200 2D/3D AGP
  - 15" monitor
- 3. Laser printer 2 no.
  - 8 pages per minute print speed
  - 600 X 600 dpi resolution
  - Network interface card

Software requirements

The software required for the system are:

Server unit:

- Windows NT operating system

Client units:

- Oracle Developer/2000
- Microsoft Access 97

#### 3.4 Security and Control

The Proposed Cost Engineering System provides protection scheme for information security in the computer network. The database of the system is under

#### ABAC GRADUATE SCHOOL LIBEARY

"share via access limitation". This means the operating system checks the permissibility of each access by a specific user to a specific object or data, to ensure authorized access.

Normally user-oriented access control is enforced as control from user side. It requires user log on by entering user identifier and password. As the network of centralized distributed environment, it provides log on service to determine who is allowed to use the network.

In case of more sensitive data protection such as at time of preparing cost proposal for new project bidding, apart form user access control procedure, data-oriented access control is also used as control from server side. The DBMS at server side will enforce control access to specific records of data as another level of security check. Only selected individual, such as Cost Engineering Manager or Project Manager may then have access to the bid cost information.

The password strategy uses "proactive password checker scheme" which allows the user to select his or her own password. The following rules are enforced in selecting password:

- Passwords must be at least eight characters long.
- Passwords must include uppercase, lowercase and numeric digits.

As for antivirus approach, the system uses full-featured protection of scanning and activity trap components. The antivirus software, once purchased, can be updated from time to time via internet from the manufacturer's website.

Backup file scheme is also used for security reasons. The backup is kept in ZIP drive disks which have much storage capacity and need only one cabinet to keep. Transaction files require daily backup and master files weekly.

#### 3.5 System Cost Evaluation and Comparison

#### 3.5.1 Cost Analysis

The cost of new system installation needs to be justified to prove that it renders cost-saving and cost-avoidance benefits in appropriate time after implementation. Quantitative estimates of costs and benefits have been studied.

The cost of the new system consists of:

- Development costs (fixed costs)
- Operational costs (variable costs)

Development Cost

This includes the cost of new hardware, software, LAN connection and implementation.

Hardware	NB :
- Database server	150,000
- Client PC (2 no. @ 58,000 Baht)	116,000
- Laser printer (2 no. @ 23,000 Baht)	46,000
- Network accessories and connection	140,000
Total investment cost (Baht)	<u>452,000</u>
Software	
- Network operating system	85,000
- DBMS software	180,000
Total software cost (Baht)	265,000
Implementation cost	
- System development	200,000
- Employee training	80,000

Total implementation cost (Baht)	280,000
Total Development Cost (Baht)	<u>997,000</u>
Operational Cost (Annual Cost)	
- System maintenance	20,000
- Consumable supplies	38,000
Total Operational Cost (Baht)	<u>58,000</u>

#### 3.5.2 Benefit Analysis

The benefits of the proposed system include tangible and intangible benefits.

<u>379,</u>10

Tangible benefits

- Cost reduction due to less waste	379,100
------------------------------------	---------

Total Annual Cost Saving

Payback Period

Payback period is calculated to determine the number of years the investment of proposed system is recovered. The equation for payback period is:

$$P = \underbrace{I}_{(1-T)R}$$
Where P = payback period (year)  
I = investment cost (Baht)  
T = tax rate (7%)

R = annual cost saving

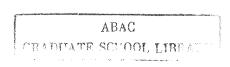

Therefore, from the aforementioned figures in 3.5.1 and 3.5.2:

$$P = \frac{997,000}{(1 - 0.07) 379,100}$$
$$P = 2.8 \text{ years}$$

Cost Items	Year 1 (Baht)	Year 2 (Baht)	Year 3 (Baht)	Year 4 (Baht)	Year 5 (Baht)
Employee Cost	945,000	1,257,000	1,456,000	1,612,000	1,841,000
Office Equipment	32,500 45,600 54,200 63		63,500	74,890	
Hardware	165,000	0	0	0	0
Software	85,000	ERSI	0	0	0
System Maintenance	34,500	43,560	55,600	68,750	83,000
Stationery & Paper	55,200	68,500	80,200	95,600	116,000
Total 1,317,200 1,414,660 1,646,000 1,839,850 2,114,890					
CABOR         VINCIT           *         OMNIA         *           *         SINCE1969         *           *         3739121ลัยอัสสัสมชิธป         *					

Cost Items	Year 1 (Baht)	Year 2 (Baht)	Year 3 (Baht)	Year 4 (Baht)	Year 5 (Baht)
Employee Cost	945,000	1,050,000	1,050,000	1,151,000	1,216,000
Office Equipment	32,500	24,500	21,200	18,600	15,800
Hardware	452,000	0	0	0	0
Software	265,000	ERS	0	0	0
System Development	280,000	0	0	0	0
System Maintenance	20,000	30,000	35,000	45,600	56,200
Stationery & Paper	38,000	32,000	21,500	8,500	7,800
Total	2,032,500	1,136,500	1,127,700	1,223,700	1,295,800
้ รากอากอยู่กัล เป็นจริง					

Table 3.2.Annual Cost of Proposed System.

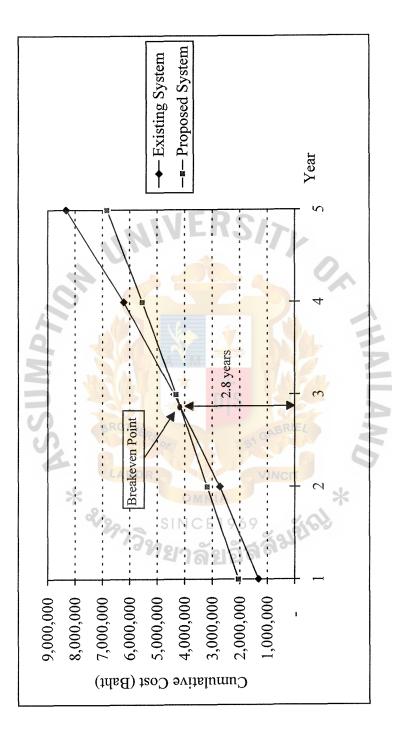

Year	The Proposed System Cost		The Existing System Cost		
	Period (Baht)	Cumulative (Baht)	Period (Baht)	Cumulative (Baht)	
1	2,032,500	2,032,500	1,317,200	1,317,200	
2	1,136,500	3,169,000	1,414,660	2,731,860	
3	1,127,700	4,296,700	1,646,000	4,377,860	
4	1,223,700	5,520,400	1,839,850	6,217,710	
5	1,295,800	6,816, <mark>200</mark>	<mark>2,144,89</mark> 0	8,332,600	

 Table 3.3.
 The Cost of the Proposed System and the Existing System.

#### Break-Even Analysis

Figure 3.2 illustrates the comparison between the cost of existing system and the cost of proposed system as shown in Table 3.3. The cost of existing system begins at 1,317,200 Baht and climbs to 8,332,600 at year 5. The cost of proposed system begins at 2,032,500 Baht and climbs to 6,816,200 at year 5. The two curves intersect at around year 2.8, which is the break-even point. Therefore the investment of the proposed system will be recovered within the period of less than 3 years.

#### Intangible Benefits

#### Improved Service-Level Benefits

With the proposed system, it takes around 5 hours to prepare monthly summary cost report. Currently at least 2 days are needed to collect and key-in data from other departments and verify the validity of data before the final report can be concluded. Improved-Information Benefits

The proposed system is expected to produce better information for cost status monitoring and decision making. The reports will be more complete and reliable with latest updated information at time of reporting.

The improved-service level and improved information benefits can be perceived by the user and the management. The monetary value is not measured.

#### **IV. PROJECT IMPLEMENTATION**

#### 4.1 System Implementation

System Prototyping

The proposed system uses contract programming for installation of the network management software – Windows NT and database management software Oracle 8 and Microsoft Access. The selected softwares are domain-independent - being built for a variety of processing environments and their specifications are suitable for the Cost Engineering System requirements. The interface of input, output, databases, modules and controls can be easily reviewed.

Working model of cost information system is created to determine if the design meet user needs and expectations.

Prototypes includes the screen data entry and data reporting facilities. The steps are as follows:

Design screen and data files. Identify the fields on data entry screen and corresponding fields for each record to be stored on files.

- 2 Collect some data as sample.
- 3 Produce report based on information stored on files.
- 4 Identify problems with the report format and contents.
- 5 Collect some new data.
- 6 Report on the files.
- 7 Return to step 4 if the report continues to show problem.

With all the system design documentation illustrate in context diagrams, data flow diagrams and structure charts, the users can evaluate the requirements of processing and determine if the proposed design meets their requirements. Documenting computer ccde

or to identify and explain the steps of processing is shown in Appendix C – Process Specification.

#### System Testing

The proposed softwares have been tested to assure that they are easy to use and good for the purposes of the system.

Since the system focuses on the inputs and outputs with no interest on how instructions are executed within each modules, black-box testing is used. The test includes:

- Stress test which is used to test for system capacity and determine throughput and response time characteristics of the system. It is expected that the system will be able to handle around 20,000 cost code with up to unique 50 fields

- Normal path test is used to see if the system can handle valid data so that all valid inputs bring about valid results.

- Error path test is used to see how the system handles invalid data.

System Conversion

The installation of system softwares is just add new features to the existing computer-based operation. The activities in system conversion include:

- Creating new database
- Installing new system
- Completing all work procedure
- Completing all documentation
- Training the users

The conversion uses parallel method on system changeover. The old operation can still be undertaken in concurrent with the new system until the users and company are

#### ABAC GRADUATE SCHOOL LIBRARY

ready to fully comply to the new system. The results of the new system can be compared to the old one. If any deviation occurs in the results, corrective actions can be taken. This includes changing or modifying the coded instructions.

User Training

Training session is required to provide the users with hand-on experience with the new system. The comprehensive/progressive training programs are organized one for the cost engineers and another for cost technicians. The program covers all system functions, operation procedures and system maintenance method. The training course start with 3 day classroom training and followed by 3 month on-the-job training. The period is adequate to provide the user time to learn about the new system environment. Since the system is designed to be interactive, users can easily try out the softwares, with only little supervision from the analysis team.

System Maintenance

To keep the software current with the changing processing requirements, to fix the errors of defects of the software and to keep up with changes in computer technology, system maintenance plan have been developed. The plan includes adaptive maintenance, corrective maintenance and perfective maintenance.

Adaptive maintenance will be undertaken when the programs need to be modified to incorporate new system requirements. Routine maintenance tasks using utility programs include:

- File copying and back-up

To copy data files and database and store them in safe locations to be retrieved or restored when needed.

- File reorganization

Since the system deals with extensive volume of data, reorganization of master files need to be done periodically when records are deleted and written to overflow areas.

- Table update

Data in tables need to be regularly updated when required to keep the system information reliable and valid.

Corrective maintenance is required in response to software failure. To track the problems, Critical incident reports will log the software failures, their probable cause and corrective action taken. These reports help identify classes of errors: program logic error, system errors, operation errors and user errors.

Perfective maintenance is to improve or maintain program efficiency. One example is to modify program data structures by simplifying the organization of data structure.

#### V. CONCLUSIONS AND RECOMMENDATIONS

#### 5.1 Conclusions

Cost Engineering is one of the most vital management information and control functions of construction company. The use of work breakdown structure or cost code is basic framework to interrelate costs, schedules, responsibilities and other factors utilizing the common code. Control budget are derived from estimates of costs and quantities, and usually provide a structure for recording actual performance, making forecasts, showing variations and documenting reasons for unexpected problems. The need to recategorize the costs from the estimate record to serve the needs of effective cost control is likely in many projects. Field construction cost control focuses on labour and equipment, with main sources of data from time sheets and estimates or surveys of quantities of work in place. Data from other parts of control system, including scheduling, accounting, procurement and quality assurance are also used for consistency, comparisons and interrelated factors. Theory and principles of engineering economy is also useful in making comparative economic evaluation of alternatives in design or construction and in developing cash flows for project finance. Cost engineering is an interface between management, line supervisors, scheduling, procurement, accounting, field engineers, and others. With the use of computer network system with central database management the integration of information from several work divisions can easily be bound together and provide more synchronized environment in producing useful information for decision making and problem solving. The degree of achievement in using the proposed system can be measured in terms of transaction time. The transaction time for input screen, output report, data update and data retrieval is faster as shown in the Table 5.1:

Transaction Time	Existing System	Proposed System
Input Screen	15 minutes	6 minutes
Output Report	55 minutes	20 minutes
Data Update	45 minutes	10 minutes
Data Retrieval	8 minutes	3 minutes

Table 5.1. Transaction Time Comparison.

#### 5.2 Recommendations

To have effective cost control, the trends of cost must be established as soon as possible and be compared against both the planned and actual progress. Project cost code should be simple, concise and easy to interpret. The breakdown structure needs to be consistent and deliberately developed from the beginning, never be changed in the middle of the project.

Together with the system implementation, standard data definitions from application to application up until department to department need to be initiated for data integrity purpose. Such data consistency, under careful administrative control, is essential in developing management information. Tracking and reporting on construction project cost status with full supportive information from other related business functions is possible.

Database system, once designed, may need to be modified from time to time to keep up with different levels of purpose. From initial phase, it is expected to meet shortterm application-oriented goals of routine transaction processing. After that, long-term data-oriented goals of managing information as corporate resource should be of upcoming need to anticipate.

## APPENDIX C

OldMPTIO. PROCESS SPECIFICATION

SINCE1969

าลัยอัสลัมข์เป

AILAN,

\*

### **Process Specification**

Process 1 to 3 are fundamental elements for the setting up of database for all cost engineering information system at early stage of project. These processes develop items of work for cost information. New and unforeseen work items may be added from time to time when figured out during later stage of the construction project. The project cost code developed in Process 3 is then used as primary key in developing fields for all cost-related information which are mostly numerical data, also key to retrieve the cost item when updating cost data or preparing reports.

Process 4 to 8 involve the development of various reports combining various fields of information from Process 1 to 3. These reports are submitted to management and line manager of mostly Procurement, Construction and Accounting & Finance Departments. They are required to be prepared and revised in regular basis, usually every month.

Process1 Develop Work Element List

Work Element List of item of all works in the project is fundamental data for cost control and monitoring of Cost Engineering System.

Process 1.1: Review Project Information

Project information to be reviewed are design plan and specifications and design drawings so that generic type of work for the project can be roughly figured out.

Process 1.2: Review Cost Items

Review items of cost from preliminary cost estimate schedule from Estimate Cost Master File which was developed and used in project bidding stage.

Process 1.3: Refer to Master format

59

Refer to CSI's Master format as guideline to classify and categorize the works of project.

Process 1.4: Determine Cost Element

Rearrange the cost item from cost estimate schedule into work element list according to Master format work division. Then store Work Element List in Work Structure Master File.

Process 2 Develop Work Breakdown Structure

Work Breakdown Structure is numbering system used to describe work element of project.

Process 2.1: Indicate Project Identifier

To identify type or function of the project.

Process 2.2: Indicate Facility Number

Facility number is major division of each work element. This number is used for accounting purpose.

Process 2.3: Indicate Element of Work

To indicate standard element of work, work element detail code and work element detail designator. It consists of 4 numerical characters.

Process 2.4: Indicate Element of Cost

To indicate basic element of cost number and further detail of basic cost number.

This number is used for financial purpose.

Process 2.5: Write Word Description

Write description of each work element in lowest but comprehensive details.

Process 2.6: Indicate Reference Code

This is additional information used to refer to responsibility, subcontract,

specifications, zone and system of each work element. The numbering system is the

same as used in scheduling program of Planning Department. Then store the work breakdown structure in Work Structure Master File.

Process 3 Develop Project Cost Code

Project Cost Code is used to classify and categorise items of works of project for cost record and control purpose.

Process 3.1: Indicate Project Number

The project number consists of 4 subdivisions in alphanumeric:

- The first two digits are the year when the project starts.

- The third digit is the status of the contract.

- The fourth is the type of the construction work.

- The last two digits indicate sequence of the project taken during that year.

Process 3.2: Indicate Area-Facility Code

Area-facility code is numerical.

This code can be "floor" in case of building, or the division of construction structures to be defined for each individual project.

Process 3.3 : Indicate Work Type Code

Work type code is work division based on Master format. The code is numeric.

Process 3.4: Indicate Distribution Code

Distribution Code identifies the resource components of type of work. It separates the type of work into labour, materials, equipment and subcontract costs to facilitate the preparation of detailed cost estimate and cash flow forecast.

Process 4 Prepare Project Budget Report

Project Budget Report provides budget cost of project used as cost control and monitoring information from early stage of project until the end of project. It is used as basis to the procurement of project resources.

61

Process 4.1: Review Estimate Cost Record

Review Cost Estimate Record from Estimate Cost Master File developed during project bidding stage.

Process 4.2: Retrieve Project Cost Code

Retrieve Project Cost Code from Work Structure File (Process 3).

Process 4.3: Update Work Quantity

Update quantity of works referring to Quantity Schedule provided by Planning Department.

Process 4.4: Update Budget Cost

Update budget cost item in relevant Cost Code and according to latest cost and project information. Then store the revised cost in Control Budget Master File.

Process 5 Prepare Resource Schedule

The Resource Schedule is used by Procurement Department to develop plan for purchasing and obtaining project resources i.e. equipment, materials, supplies, services and labour required in the project. It is used to determine the right time to procure resources required in the most economical manner.

Process 5.1: Identify Resource Items

List resource items i.e. equipment, materials, supplies, services and labour from Construction Schedule developed by Planning Department.

Process 5.2: Determine Resource Quantity

Determine quantity of each resource items required for the project based on Construction Schedule.

Process 5.3: Allocate Budget Cost

Allocate budget cost of each resource items based on Project Budget Report.

Process 5.4: Allocate Time Schedule

Allocate Time Schedule of each resource items based on Construction Schedule.

Process 5.5: Enter Market Price

Enter Market Price of each resource items received from Procurement Department. Then submit the Resource Schedule to Procurement Department

Process 6 Prepare Summary Cost Report

Summary Cost Report describes the actual and forecast status of project cost. It commences with the preliminary estimate and ends when the project is complete with all claims, if any, have been settled.

Process 6.1: Retrieve Cost Estimate Summary

Retrieve Cost Estimate Summary from Cost Estimate Master File.

Process 6.2: Update Work at Completion

Update Work at Completion in quantity based on Field Measurement information

from Construction Department which reports progress quantity of construction works.

Process 6.3: Update Cost at Completion

Update Total Cost Committed amount based on Income/Expense Report from Accounting & Finance Department.

Process 6.4: Enter Variation Cost

Enter Variations Cost based on Work Variation information from Construction

Department (if any) which cause impact on project costs.

Process 6.5: Update Total Cost Committed Amount

Update Total Cost Committed Amount which is the original amount of work plus

the amount of Work Variation.

Then store Actual Cost Record in Actual Cost Master File.

1. The second s second se second s

ABAC GRADUATE SCHOOL LIBRARY

Process 7 Prepare Cash Flow Report

Project Cash Flow Report is used by Accounting & Finance Department and Management for project financial planning and control. The report gives gross cash requirements for expenses throughout the project and also determines working capital requirements for the company and in setting up lines of credit to borrow funds at favorable rates. Cash Flow Reports are regularly prepared to accompany Cost Reports.

Process 7.1: Retrieve Cost Report

Retrieve Cost Report from Actual Cost Master File.

Process 7.2: Review Construction Schedule

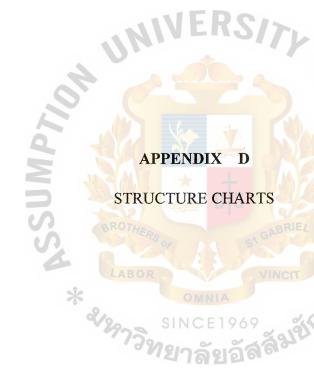

Review Construction Schedule developed by Planning Department

Process 7.3: Update Percent Work Complete.

Update Percent Complete of works based on Work at Completion in Summary Cost Report.

Process 7.4: Update Period Payment Amount.

Update Period Payment Amount according to actual payment in Cost Report and determine the projected payment based on work program in Construction Schedule, then store Cash Flow Record in Actual Cost Master File.

Identify Resource Items	Data Process	N/A	Identify items of resources required for particular project e.g. labour, material and equipment
Indicate Area- Facility Code	Data Process	N/A	Indicate area or facility that categorize physical or geographical features in particular project.
Indicate Distribution Code	Data Process	N/A	Indicate distribution code that break out the resource components of various types of work, separating out

Object Name	<b>Object Type</b>	Definition	Description
			labour, material, equipment
			and subcontract costs.
Indicate	Data Process	N/A	Indicate basic element of cost
Elements of			and its further detail as part of
Cost			Work Breakdown Structure to
			be used for financial record
			purpose. The number consists
			of 2 digits.
			Format: X X
Indicate	Data Process	N/A	Indicate standard element of
Elements of			work code, work element
Work			detail code and work element
			detail designator code as part
		IEDC	of Work Breakdown
	UNI	1 2 2 2 2	Structure to be used for
	0		accounting record purpose.
			The number consists of 4
C			digits.
			Format: X XX X
Indicate Facility	Data Process	N/A	Indicate facility/area code,
No.			subfacility/subarea code and
S			subfacility/subarea detail
5			code as part of Work
		with a log	Breakdown Structure to be
	BROTHERO	GABR	used for accounting record
			purpose.
0	LABOR	VINC	The number consists of 4
	ster in the second seco		digits.
T 1' / D ' /			Format: X X XX
Indicate Project	Data Process	SINCEN/A69	Indicate project identifier as
Identifier	Data Process	ພວະມວັດລີ່ຈີ	part of Work Breakdown
	~ * *	1.1925000	Structure. This is optional
			field used only on
L. L'este Duclest	Data D		multiproject program.
Indicate Project	Data Process	N/A	Indicate number for a
Number			particular project consisting
			of start year, type of project,
			type of contract and sequence
			with other projects that start
Tradicata	Data Drazar	NT/ 4	that year.
Indicate	Data Process	N/A	Indicate the code that is used
Reference Code			to identify responsibility,
			subcontract, specification,
			zones and systems as part of Work Breakdown Structure.
			1
			The number consists of 9
			digits.

Object Name	Object Type	Definition	Description
			Format: XXXXXXXXX
Indicate Work Type Code	Data Process	N/A	Indicate work-type code using Master format numbering standard
Prepare Cash Flow Report	Data Process	N/A	Prepare Cash-flow Report to be used for project financial planning & control by Accounting & Finance and Management
Prepare Project Budget Report	Data Process	N/A	Prepare Project Budget Report for monitoring and control cost status of project
Prepare Resource Schedule	Data Process	N/A	Prepare Resource Schedule to be used in planning the procurement of resources required in project
Prepare Summary Cost Report	Data Process	N/A	Prepare Summary Cost Report to provide actual and forecast cost status information of project to the Management
Refer to Master format	Data Process	N/A DIS	Refer to Master format for construction work classification number.
Retrieve Actual Cost Record	Data Process	N/A SI GABI	Retrieve Actual Cost Record form Actual Cost master file.
Retrieve Project Budget	Data Process	N/A VINC	Retrieve Project Budget Record from Control Budget master file
Retrieve Project Cost Code	Data Process	แNCEN/As9 ยาลัยอัสสั <sup>3</sup>	Retrieve Project Cost Code from Work Structure master file.
Review Construction Schedule	Data Process	N/A	Review Construction Schedule to see work trend and forecast
Review Cost Estimate	Data Process	N/A	Review Cost Estimate Record from Estimate Cost master file to use as guideline
Review Cost Items	Data Process	N/A	Review cost items from Estimate Cost master file
Review Project Information	Data Process	N/A	Review project information in terms of cost aspects
Update Budget Cost	Data Process	N/A	Update Budget Cost of each work element item by item according to current Quantity Schedule
Update Cost at	Data Process	N/A	Update Cost at Completion

Object Name	Object Type	Definition	Description
Completion			based on Income/Expense Report provided by Accounting and Finance Department
Update Percent Work Completed	Data Process	N/A	Update percentage of work completed according to Construction Schedule.
Update Period Payment Amount	Data Process	N/A	Update Period Payment Amount according to Income Report
Update Total Cost Committed Amount	Data Process	N/A	Update Total Cost Committed Amount based on actual work progress and cost progress of the project.
Update Work at Completion	Data Process	N/A	Update Work at Completion based on Field Measurement provided by Construction Department.
Update Work Quantity	Data Process	N/A	Update Work Quantity based on current Quantity Schedule prepared by Planning Department.
Write Word Description	Data Process	N/A	Write word description of work element in short but comprehensive detail.
Actual Cost Master File	Data Store	Project Cost Code, Work Done Quantity, Work Done Cost, Variation Quantity, Variation Cost, Cumulative Quantity, Cumulative Cost, Cost to Complete, Cost at Completion,	File that keeps all cost information according to actual work progress and cost incurred in work operation
Control Budget Master File	Data Store	Project Cost Code, Latest Quantity, Latest Cost, Expected Income	File that keeps the budget cost of project in which work quantity and relevant cost are regularly updated according to actual Quantity Schedule
Estimate Cost Master File	Data Store	Word Description, Prelim. Total	File that keeps cost estimate information of work items of particular construction project

Object Name	Object Type	Definition	Description
		Quantity, Unit,	prepared during project
		Unit Cost -	bidding.
		Labour, Unit	
		Cost - Material,	
		Total Estimate,	
		Contract Price	
Work Structure	Data Store	Project Cost	File that keeps work elements
Master File		Code, Project	of project in categorized
		Number, Area-	numbering system of
		Facility Code,	area/facility, work type
		Work-Type	(Master format), means of
		Code,	cost distribution and
		Distribution	combined into Project Cost
		Code, Word	Code.

## APPENDIX I

MoldMDSSN \* alan CSI'<mark>S M</mark>ASTE<mark>R FORMA</mark>T

## **CSI** Master format

This Appendix contains the Master format for construction classifications, as published by the Construction Specifications Institute (CSI), 601 Madison Street, Alexandria, Virginia. It is applicable to organizing specifications sections, drawings, cost codes, materials information, office correspondence and other aspects of design, procurement and construction.

Bidding Requirements, Contract Forms and Conditions of the Contract

- 00010 Pre-bid information
- 00100 Instructions to bidders
- 00200 Information available to bidders
- 00300 Bid forms
- 00400 Supplements to bid forms
- 00500 Agreement to bid forms
- 00600 Bonds and certificates
- 00700 General conditions
- 00800 Supplementary conditions
- 00900 Addenda

Specifications

- Division 1 General requirements
- 01010 Summary of work
- 01020 Allowances
- 01025 Measurement and payment
- 01030 Alternates/alternatives
- 01035 Modification procedures

- 01040 Coordination
- 01050 Field engineering
- 01060 Regulatory requirements
- 01070 Identification systems
- 01090 References
- 01100 Special project procedures
- 01200 Project meetings
- 01300 Submittals
- 01400 Quality control
- 01500 Construction facilities and temporary controls
- 01600 Material and equipment
- 01650 Facility startup/commissioning
- 01700 Contract close-out
- 01800 Maintenance
- Division 2 Sitework
- 02010 Subsurface investigation
- 02050 Demolition
- 02100 Site preparation
- 02140 Dewatering
- 02150 Shoring and underpinning
- 02160 Excavation support systems
- 02170 Cofferdams
- 02200 Earthwork
- 02300 Tunneling

- 02350 Paving and surfacing
- 02600 Utility piping materials
- 02660 Water distribution
- 02680 Fuel and steam distribution
- 02700 Ponds and reservoirs
- 02780 Power and communications
- 02800 Site improvements
- 02900 Landscaping
- Division 3 Concrete
- 03100 Concrete formwork
- 03200 Concrete reinforcement
- 03250 Concrete accessories
- 03300 Cast-in-place concrete
- 03370 Concrete curing
- 03400 Precast concrete
- 03500 Cementitious decks and toppings
- 03600 Grout
- 03700 Concrete restoration and cleaning
- 03800 Mass concrete
- **Division 4 Masonry**
- 04100 Mortar and masonry grout
- 04150 Masonry accessories
- 04200 Unit masonry
- 04400 Stone

- 04500 Masonry restoration and cleaning
- 04550 Refractories
- 04600 Corrosion resistant masonry
- 04700 Simulated masonry

**Division 5 - Metals** 

- 05010 Metal materials
- 05030 Metal coatings
- 05050 Metal fastening
- 05100 Structural metal framing

05200 Metal joists

- 05300 Metal decking
- 05400 Cold formed metal framing
- 05500 Metal fabrications
- 05580 Sheet metal fabrications
- 05700 Ornamental metal
- 05800 Expansion control
- 05900 Hydraulic structures
- Division 6 Wood and plastics
- 06050 Fasteners and adhesives
- 06100 rough carpentry
- 06130 Heavy timber construction
- 06150 Wood and metal systems
- 06170 Prefabricated structural wood
- 06200 Finish carpentry

## ABAG GRADUATE SCHOOL LIBRARY

SITY

- 06300 Wood treatment
- 06400 Architectural woodwork
- 06500 Structural plastics
- 06600 Plastic fabrications
- 06650 Solid polymer fabrications
- Division 7 Thermal and moisture protection
- 07100 Waterproofing
- 07150 Dampproofing
- 07180 Water repellents
- 07190 Vapor retarders
- 07195 Air barriers
- 07200 Insulation
- 07240 Exterior insulation and finish systems
- 07250 Fireproofing
- 07270 Firestopping
- 07300 Shingles and roofing tiles
- 07400 Manufactured roofing and siding
- 07480 Exterior wall assemblies
- 07500 Membrane roofing
- 07570 Traffic coatings
- 07600 Flashing and sheet metal
- 07700 Roof specialties and accessories
- 07800 Skylights
- 07900 Joint sealers

## Division 8 - Doors and windows

- 08100 Metal doors and frames
- 08200 Wood and plastic doors
- 08250 Door opening assemblies
- 08300 Special doors
- 08400 Entrances and storefronts
- 08500 Metal windows
- 08600 Wood and plastic windows
- 08650 Special windows
- 08700 Hardware
- 08800 Glazing
- 08900 Glazed curtain walls
- **Division 9 Finishes**
- 09100 Metal support systems
- 09200 Lath and plaster LABO
- 09250 Gypsum board
- 09300 Tile
- 09400 Terrazzo
- 09450 Stone facing
- 09500 Acoustic treatment
- 09540 Special wall surfaces
- 09545 Special ceiling surfaces
- 09550 Wood flooring
- 09600 Stone flooring

SITY

- 09630 Unit masonry flooring
- 09650 Resilient flooring
- 09680 Carpet
- 09700 Special flooring
- 09800 Special coatings
- 09900 Painting
- 09950 Wall coverings
- **Division 10 Specialties**
- 10100 Visual display board
- 10150 Compartment and cubicles
- 10200 Louvers and vents
- 10240 Grilles and screens
- 10250 Service wall systems
- 10260 Wall and corner guards
- 10270 Access flooring
- 10290 Pest control
- 10300 Fireplaces and stoves
- 10340 Manufactured exterior specialties
- 10350 Flagpoles
- 10400 Identifying devices
- 10450 Pedestrian control devices
- 10500 Lockers
- 10520 Fire protection specialties
- 10530 Protective covers

SITY

- 10550 Postal specialties
- 10600 Partitions
- 10650 Operable partitions
- 10670 Storage shelving
- 10700 Exterior protection devices for openings
- 10750 Telephone specialties
- 10800 Toilet and bath accessories
- 10880 Scales
- 10900 Wardrobe and closet specialties

**Division 11 - Equipment** 

- 11010 Maintenance equipment
- 11020 Security and vault equipment
- 11030 Teller and service equipment
- 11040 Ecclesiastical equipment
- 11050 Library equipment
- 11060 Theatre and stage equipment
- 11070 Instrumental equipment
- 11080 Registration equipment
- 11090 Checkroom equipment
- 11100 Mercantile equipment
- 11110 Commercial laundry and dry cleaning equipment
- 11120 Vending equipment
- 11130 Audio-visual equipment
- 11140 Vehicle service equipment

- 11150 Parking control equipment
- 11160 Loading dock equipment
- 11170 Solid waste handling equipment
- 11190 Detention equipment
- 11200 Water supply and treatment equipment
- 11280 Hydraulic gates and valves
- 11300 Fluid waste treatment and disposal equipment
- 11400 Food service equipment
- 11450 Residential equipment
- 11460 Unit kitchens
- 11470 Darkroom equipment
- 11480 Athletic, recreational and therapeutic equipment
- 11500 Industrial and process equipment
- 11600 Laboratory equipment
- 11650 Planetarium equipment
- 11660 Observatory equipment
- 11680 Office equipment
- 11700 Medical equipment
- 11780 Mortuary equipment
- 11850 Navigation equipment
- 11870 Agricultural equipment
- **Division 12 Furnishings**
- 12050 Fabrics
- 12100 Artwork

- 12300 Manufactured casework
- 12500 Window treatment
- 12600 Furniture and accessories
- 12700 Multiple seating
- 12800 Interior plants and planters

Division 13 - Special construction

13010 Air supported structures

13020 Integrated assemblies

- 13030 Special purpose rooms
- 13080 Sound, vibration and seismic control
- 13090 Radiation protection
- 13100 Nuclear reactors
- 13120 Pre-engineered structures
- 13150 Aquatic facilities
- 13175 Ice rinks
- 13180 Site constructed incinerators
- 13185 Kennel and animal shelters
- 13200 Liquid and gas storage tank
- 13220 Filter underdrains and media
- 13240 Oxygenation systems
- 13260 Sludge conditioning systems
- 13300 Utility control systems
- 13400 Industrial and process control systems
- 13500 Recording instrumentation

- 13550 Transportation control instrumentation
- 13600 Solar energy systems
- 13700 Wind energy systems
- 13750 Cogeneration systems
- 13800 Building automation systems
- 13900 Fire suppression and supervisory systems
- 13950 Special security construction
- Division 14 Conveying systems
- 14100 Dumbwaiters
- 14200 Elevators
- 14300 Escalators and moving walks
- 14400 Lifts
- 14500 Material handling systems
- 14600 Hoists and cranes
- 14700 Turn-tables
- 14800 Scaffolding
- 14900 Transportation systems
- **Division 15 Mechanical**
- 15050 Basic mechanical materials and methods
- 15250 Mechanical insulation
- 15300 Fire protection
- 15400 Plumbing
- 15500 Heating, ventilating and air conditioning
- 15550 Heat generation

- 15650 Refrigeration
- 15750 Heat transfer
- 15850 Air handling
- 15880 Air distribution
- 15950 Controls
- 15990 Testing, adjusting and balancing
- Division 16 Electrical
- 16050 Basic electrical materials and methods
- 16200 Power generation built-up systems
- 16300 Medium voltage distribution
- 16400 Service and distribution
- 16500 Lighting
- 16600 Special systems
- 16700 Communications
- 16850 Electric resistance heating
- 16900 Controls
- 16950 Testing
