ABSTRACT

This project, "Delivery Information System" is a logistic system which is suitable for management and control concerning a logistic business system. The Express Transportation Organization of Thailand (ETO.) is the case that renders the transportation service for all kinds of goods regardless any distances. This project was developed to improve the existing system operation at transportation department. The emphasis is a computerization as to provide the right delivery information at the right level of details at the right time. This study uses structured analysis and design techniques to document all activities and informal interview. The existing system is studied and analyzed, problems are identified. The new system is designed to solve on minimize the problem.
