ABSTRACT

The spent coffee grounds (SCG) contain large amount of phenolic compounds which are investigated as a potential source of antioxidant. Melanoidins is one of phenolic compounds formed during a roasting process of coffee bean and it is brown-colored compound. To increase the sustainability of SCG, *Coffea arabica* was extracted by oil infusion method. Five oils which were canola oil, corn oil, coconut oil, sunflower oil and mineral oil were used as the oil carrier for extracting antioxidant compounds from SCG, the 10%, 20% and 30% w/w of SCG were infused in each oil carriers at room temperature for 24, 48, 72, 96 and 120 hrs. The result showed that, the increasing of concentration of infusion ratio and the time period of infusion effected the increasing of the amount of total phenolic compounds (TPC) in all oil carriers. The TPC of 30% (w/w) SCG at 120 hrs of canola oil, corn oil, coconut oil, sunflower oil and mineral oil were 31.99 ± 0.06 , 35.54 ± 0.87 , 29.05 ± 0.74 , 30.37 ± 0.5 and 22.04 ± 0.72 mg/ml, respectively. The highest TPC was found in 30% w/w SCG infused in canola oil at 72 hrs. which presented 36.10 ± 0.93 mg/ml however 30% w/w SCG infused in corn oil at 120 hrs. showed the highest percentage increase of TPC comparing with carrier coconut oil ($59.4\% \pm 3.89$). All five SCG infused oils contain scavenging activity to DPPH; canola oil, corn oil, coconut oil, sunflower oil and mineral oil contains $92.31\% \pm 1.1$, $91.25\% \pm 1.9$, $48.94\% \pm 0.4$, $94.71\% \pm 0.3$ and $10.51\% \pm 0.4$, respectively. The 30% w/w infused in sunflower oil at 120 hrs. exhibited the highest antioxidant activity of $94.71\% \pm 0.3$ and IC₅₀ was 29.07 mg/ml whereas coconut oil showed the percentage increasing of antioxidant activity comparing with oil carrier was $265.23\% \pm 5.8$. For the brown-colored development, the infusion ratio and period of infusion influenced the increasing of color in all oil carriers significantly. Peroxide value were increased when SCG was infused in canola oil, corn oil, and sunflower oil, the value were 16 meq/kg, 8 meq/kg and 36 meq/kg, respectively. however peroxide value was unchanged in coconut oil and no peroxide value found in mineral oil. For antioxidant soap bar with SCG scrubber made with 5 types of SCG infused oil and with oil carrier, samples were tested for preference test, 20 panelists graded liking score range from 1 to 9 followed by these attributes, color, fragrance, lather moistening, scrubbing, skin feel and over all liking. Data from the test was statistically proved by Duncan multiple range test. The result showed that infused mineral oil soap had highest moistening score as 6.75 ± 1.16 .

Keywords: Spent coffee ground (SCG), Oil infusion, Melanoidins, Antioxidant activity, Soap bar

ACKNOWLEDGEMENT

I would like to express my special thanks of gratitude to my advisor; A Sireerat Laodheerasiri. Faculty of Biotechnology, Assumption University who helped me made this project happen and gave me great advices as well as broaden my knowledge. Including, providing room and raw materials.

Also, I would like to thank Dr.Siriwan Panprivech, Faculty of Biotechnology, Assumption University who guided me in part of total phenolic compounds and antioxidant activity.

And, I would like to thank Dr. -Ing. Tatsawan Tipvarakarnkoon, Faculty of Biotechnology, Assumption University; for guided me how to further develop this glycerin soap product.

Besides these, I would like to thank Miss Thipthida Kaewtathip, Institute of Food Research and Product Development (IFRPD) Kasetsart University who provided me Arabica spent coffee ground.

Finally, I would like to thank my family for supporting and encouraging me. Also thank to my friends for helping me and each other in all the semesters since we had been study together

CHAPTER I

INTRODUCTION

Coffee is the most popular beverage in the world with the second world trade community while the biggest is Petroleum. There are two main species of coffee that cultivate for consumption, *Coffea Arabica* (Arabica) and *Coffea canephora var. robusta* (Robusta). Because of Arabica its taste milder and more intense flavor, 70-70% of coffee's cultivation is Arabica.

The coffee after cultivation and preparation will get through roasting process then milling to form coffee powder use in brewing, after brewing process, a cup of espresso is made and the residue coffee is called "spent coffee ground" or SCG. Mostly it will be disposed as solid waste of fertilizer because it does not have commercial value. In some case, SCG are transformed into value added product by used as raw material of producing bioethanol or biofuel. Add reference

The main component of phenol in green bean coffee is chlorogenic acid which is formed by esterification, consists of trans-cinnamic acids (caffeic, ferulic and *p*-coumaric acids) with hydroxyl groups on quinic acid. During coffee brewing process, chlorogenic acid is degraded by the heat and hydrolysis into smaller structure compounds such as caffeine and mostly are the soluble compounds. Besides this, the coffee beans during roasting process due to the high temperature applied in the process lead to transformation of chlorogenic acid into melanoidin which represents the brown colored compound, that come from Maillard reaction between reducing sugar and amino acid. Add reference Therefore, infusion oil process is used to extract the non-soluble melanoidin through the carrier oil and increase the total phenolic compound and antioxidant activity included with the change of color in infused oil.

In this study, the oil infusion method was used to extract nonsoluble compounds "melanoidin" by vary the type of oil carrier. The SCG-infused oil had potential to make antioxidant soap bar because of the phenolic compounds which isolated from spent coffee ground. Antioxidant compounds can protect skin from the sun light and helping the cell from the damag by free radical. Glycerin based soap was used for making soap bar due to its transparency. Besides this, SCG was applied in the soap bar as a scrubber in order to boost cleansing ability.

This project aims to study the effectiveness of oil infusion method to extract the phenolic compounds which contain antioxidant activity from SCG and to development the glycerin soap bar added with the SCG infused oil. Furthermore, the browning color and peroxide value were also determined to indicate the characteristic of SCG infused oil.

OBJECTIVES

1. To determine the amounts of total phenolic compounds antioxidant activity and color development in different types of oil carriers after oil infusion method.
2. To study the effect of infusion ratios and infusion times on the phenolic compounds, antioxidant activity, color and peroxide value development in spent coffee ground infused oil
3. To compare the attributes between different type of infused oil glycerin soaps

CHAPTER II

LITTERATURE REVIEW

1. Coffee

1.1 Robusta & Arabica

Coffee are cultivated in more than 50 countries, consist of Asia, Africa, America and Caribbean region. There are two spices of coffee those are the most cultivation in the world due to its unique taste and smell which are Arabica (*Coffea arabica*) 75% and Robusta (*Coffea canephora*) 25% of the world's cultivation.

When these two spices of coffees are made, their taste and aroma are different which Arabica has a much more intense flavor and complex aroma of those flowers, fruit, honey and chocolate. Robusta is more concentrated by its bitterness and is less aromatic. Although Arabica is more intense in aroma, Robusta contains almost twice amount of caffeine. The 100% Arabica is considered to be the best coffee in the world and much more superior than Arabica blend with Robusta (Jansen, 2006).

1.2 Spent coffee ground

After coffee beverages are made, a solid residue known as spent coffee grounds (SCG) is produced. Normally, SCG are disposed as a solid waste. It needs a proper management in order to get rid of SCG waste. Burning is not the good way to do, due to its bioactive compound which such as polyphenols, caffeine and tannins, can lead to production of greenhouse gas which directly bad effect to atmosphere. To avoid making the air pollution, there are many ways to make it more value, SCG can use as fertilizer for planting or raw material of biofuel production due to high organic compound in it. (Alessia Panusa, 2013)

1.3 Phenolic compound in coffee

Coffee contains large amount of phenolic compound. Phenolic compounds are found as a main composition of compound in plants, which has high in antioxidant activity to prevent or slow down oxidation reactions that destruct their cells. Mostly found in seeds and green leaves.

1.3.1 Chlorogenic acids (CGA)

Chlorogenic acid can be separated into two main groups which are mono-caffeoyl and di-caffeoyl acids. Robusta coffee contains more di-caffeoyl acids than Arabica coffee. Most of di-caffeoyl acids are hard to decompose in roasting process and remain barely unchanged in form that promote bitter taste in coffee and exhibit harsher taste profiles in Robusta, beside this the harsh taste present by di-caffeoyl acids in plant are effective protection of insects. Whereas, mono-caffeoyl acids are simply in structure and much more easier to decompose pass though roasting process

Chlorogenic acids formed by esterification consist of caffeoylquinic acids (CQA) with the main isomers (3-, 4- and 5-CQA), and related compounds such as caffeic acid, ferulic acid and p-coumaric acid; these compounds are the main of the phenolic fraction occurring in green coffee beans (Figure 1). (Alessia Punusa,2013) Chlorogenic acid content in green coffee bean was shown in Table 1.

1.3.2 Melanoidin

Polyphenols in coffee like Chlorogenic acids are changed in structure or composition pass though the roasting process that high in temperature promote Maillard reactions between reducing sugars and free amino group, some of phenolic compounds are deconstructed, meanwhile new phenolic compounds with antioxidant activity are formed. (www.coffeechemistry.com/news/health/antioxidants-in-coffee, 2010). The final products of Maillaard reactions are Melanoidins. Melanoidins are high molecular weight nitrogenous brown colored compounds formed during roasting process. Its structures are largely unknown due to its complexity. Melanoidins consist of soluble and non-soluble groups and account up to 25% of dried coffee beans (Figure 2). (Moreira AS, Nunes FM, Domingues MR, Coimbra MA. 2012.)

2. Free radical and Antioxidant

Free radicals are unstable molecules that steal electrons from stable molecules, in order to stable their molecules lead to oxidation reactions which destruct the vegetative cells or occur in blood can induce acidity and cause of many diseases in result. Free radicals are normally produced by the body in order to aid the metabolic processes call as internal source and free radical also can promoted by external source such as smoking cigarettes, alcoholic beverages, pollutant in air. They are helpful in body functions but if too many, it is dangerous. (Figure 3)

Antioxidants could inhibit or slow down oxidation reactions by donate pair electron to free radical in order to make it stable instead of stealing from others molecule. (Figure 4) Antioxidants sources are often discussed in terms of their free radical scavenging abilities. (Susan Katchur, www.selfgrowth.com/articles/benefits-of-antioxidants-homemade-skin-care-and-more and Dr. Edward Group DC, NP, DACBN, DCBCN, DABFM, 2017. 1/8/2017)

(Joan McDaniel, 2013 1/8/2017)

Figure 4 Antioxidant reacts with free radical

(bestofbothworldsaz.com/tag/free-radical-theory-of-aging/ 1/8/2017)

3. Oil infusion

Infusion is the method that extracting out of chemical compound or flavors in plant material pass through the solvent. Infused oil, also referred to as macerated oil, and consists of oil carrier that has been permeated “infused” or “macerated” with one or more herbs. Infused oils will contain the properties of essential compound in both used herbs and oil itself. In some case, oil infusion is not suitable for extracting some plants that are less in essential oils content. (www.aromaweb.com/articles/whatinfu.asp 1/8/2017) In spent coffee ground, due to its lipids and melanoidins content, oil infusion method is expected to carry out of phenolic compounds in coffee.

There are two methods to create infused oil, the cold method and the hot method. The cold method, which is done at room temperature, takes time but easy and requires little attention while the oil is soaking in the herb's qualities. The hot method requires a direct heat source and close attention, but takes shorter time than cold method. (Candace Hunter, 2008) From the study, oregano and rosemary were infused in olive oil by varying the period of infusion (24, 48 and 72 hours). Most of panelists judged the odor and flavor as medium strong to strong, however there was no significant different between infusion time. (Mayada Damechki, 2001, 7/8/2017)

3.1 Oil carrier

The various type of oil could be used as carrier oil for infusion and extraction the active compounds from herbs and plants.

3.1.1 Canola oil

Canola oil is light yellow and has a neutral taste of brassica plants. In general, canola seeds pressed either employing traditional cold-pressing methods or in large scale, by hexane extraction method. Color, taste, and odor of cold-pressed oil indeed more pronounced than that of refined oil. In addition, the content of saturated fatty acids of canola oil is the lowest among all common sources of vegetable oil. (<http://www.nutrition-and-you.com/canola-oil.html>, Fereidoon Shahidi and Udaya Wanasundara , 1994, 7/8/2017)

3.1.2 Corn oil

Corn oil is extracted from the germ of corn. These germs are rich in omega-6 and oils. There are various methods of extracting oil from the seed germs. The oil when extracted is dense and needs to be refined before it is used for cooking purposes. One can also use unrefined oil as it contains more of health boosting plant phytochemicals. (oilhealthbenefits.com/corn-oil/, 2017, 7/8/2017)

3.1.3 Coconut oil

Coconut oil is derived from the seeds of coconut palm, *Cocos nucifera*. Commercial coconut oil is made from copra or the dried kernel meat of coconut and goes through refining, bleaching and deodorizing processes. Coconut oil is considered a saturated fat because it contains more than 90% saturated fatty acids which is good for health. (A. M. Marina, Y. B. Che man, S. A. H. Nazimah & I. Amin, 2009, 7/8/2017)

3.1.4 Sunflower oil

Sunflower oil is produced from oil type sunflower seeds. There are two types of sunflower seeds – confection sunflower seeds and non-oil sunflower seeds. Confection sunflower seeds are edible and are used for the extraction of oil whereas non-oil sunflower seeds are used for feeding animals and are not suitable for human consumption. Sunflower oil is light in taste and appearance and supplies more Vitamin E than any other vegetable oil. It is a combination of monounsaturated and polyunsaturated fats with low saturated fat levels. (Saba 2017, www.sunflowernsa.com/oil, 7/8/2017)

3.1.5 Mineral oil

Mineral oil is clear and colorless, oily liquid that is a by-product of the distillation of petroleum. Mineral oil is used in medicine as a laxative and as an emollient. Mineral oil is completely indigestible and is not absorbed by the intestine. Its prolonged use may cause vitamin deficiencies. Mineral oil applied to the skin makes the latter softer and more pliable by retaining moisture within the epidermis. (The Editors of *Encyclopædia Britannica*, www.britannica.com/technology/mineral-oil, 7/8/2017)

4. Glycerin soap bar

Glycerin soaps have unique quality of moisturizing that is effective for all different kinds of the skins. It makes your skin moisturized and healthy. By these reasons, Glycerin soaps are considered to be one of the most moisturizing types of soap. Glycerin soaps promote moisture to your skin and hold it still. Beside this, glycerin soap keeps your skin feeling more hydrated than others types of soap that dried the skin, make it feel tight and even flaky. That why glycerin is a good skin humectant.

When the skins are moisturized, it is promote healthy skin by preventing of developing of wrinkles, stretch marks and tears in skins. Glycerin soap also suitable for using as facial washer more than harsh soap that dried skin and creating extra oil. Glycerin soap can help decrease or completely rid of acne problem. (RIPA AJMERA, 2017, 1/8/2017)

5. Lipid oxidation and peroxide value

Oxidation of lipid could be classified into positive and negative effect, in process of utilizing fatty acid to production of energy through β -oxidation. Oxidation is also involved in the production of signaling substances called eicosanoids. These are formed from the omega-3 fatty acid eicosapentaenoic acid (EPA) and the omega-6 fatty acid arachidonic acid (AA) by the action of specific enzyme systems. Besides this, oxidation also results in damaging the cells by free radicals stealing electrons in order to form a stable molecule and it is also the first step in the formation of several cytotoxic and mutagenic substances.

Peroxide value is the measurement level of oxidation of a fat or oil containing polyunsaturated fatty acids, the cause of rancidity. A measure of hydroperoxides in oxidized oil. These are measured quantitatively on the basis of their ability to liberate iodine from acidic solutions of potassium iodide. This can be measured by titrating with sodium thiosulphate solution or electrochemically. (Dr. Kristi Ekrann Aarak and Dr. Linda Saga, BioActive Foods, www.1life63.com/en/omega-in-your-body-oxidation-of-lipids/oxidation-of-lipids, 7/8/2017)

Methods

1. Preparation of spent coffee ground

The coffee ground passed from the brewing process which contain a lot of water content were collected and used further for drying process. SCG was collected from Art Coffee Shop at Kasertsart University; samples were collected 3 times and then blended together. The SCG was dried in hot oven at temperature 40°C until the weight constant in order to prevent compound destruction. The dry spent coffee ground was kept in the aluminum bag at room temperature.

2. Spent coffee ground oil infusion

Essential compounds in SCG were extracted by oil infusion technique. Five types of oil were purchased from the Thailand grocery shop and applied for oil infusion (Canola, Corn, Coconut, Sunflower, and Mineral oil). The infusion ratio were prepared as 45 g : 5 g of oil : SCG (10% w/w), 40 g : 10 g of oil : SCG (20% w/w) and 35 g : 15 g of oil : SCG (30% w/w) in the nontransparent bottle. The SCG in each oil (total 50g) were extracted at room temperature for 24 hrs (day1), 48 hrs (day2), 72 hrs (day3), 96 hrs (day4) and 120 hrs (day5) and agitated one time per day. The SCG infused oils were collected by filtration method using multi-layer thin white cloth and kept in non-transparent container at room temperature for for chemical characteristic analysis

3. Sample preparation for chemical analysis

3.1 Sample preparation for total phenolic compounds assay

Weight 2.5g of infused oils sample and mixed with 15 ml of 70% acetone solvent (70:28:2, acetone/distilled water/acetic acid) then shakes 30 minutes in the dark place and centrifuged at 4000 rpm. for 10 minutes. After that, collected the watering part for analyzing by folin-ciocalteu's method. The control oil carrier was also prepared with the same procedure.

3.2 Sample preparation for DPPH scavenging Assay

Dissolved 1 g of SCG infused oil sample in 10 ml of ethyl acetate solvent, the concentration of prepared sample was 100 mg/ml, then diluted sample solution into concentration of 20, 40, 60 and 80mg/ml in ethyl acetate. These five concentrations were used to determine antioxidant activity and IC 50 by DPPH scavenging method. The oil carrier with have no SCG infused was used as a control to compare the increasing of antioxidant activity.

3.3 Sample preparation for peroxide value

Dissolved 5 g of SCG infused oil in 12 ml of chloroform and 18 ml of acetic acid.

4. Study of chemical characteristics

4.1 Total Phenolic compounds by Folin-Ciocalteu's method

Prepared fresh Folin-Ciocalteu's reagent by diluting with distilled water (folin-ciocalteu's reagent/distilled water, 1:5, v/v). One ml of sample and 2 ml of folin-ciocalteu's reagent were mixed in test tube and leave it for 3 min then 10 ml of 10% (w/v) of sodium carbonate (Na_2CO_3) was added and kept in the dark for 30 min. The absorbance was measure by spectrophotometer at 725 nm. The total phenolic compound was expressed as Gallic acid equivalent. Percentage total phenolic compound increased from carrier oil was calculated by this following formula.

$$\%TPC \text{ increased from carrier oil} = \left(\frac{A_i - A_c}{A_c} \right) \times 100$$

A_c = Absorbance control (carrier oil carrier oil)

A_i = Absorbance infused oil

4.2 Anti-oxidation activity by DPPH scavenging method

The modified DPPH is scavenging technique that measured the anti-oxidant activity in the percentage reduction of DPPH. The 0.1 mM of DPPH in ethyl acetate were prepared in 100 ml Erlenmeyer flask, 0.0039 g of DPPH was dissolved in 10 ml of ethyl acetate (1mM DPPH) then topped up to 100ml with ethyl acetate (0.1mM DPPH).

Volume 1 ml of SCG infused oil prepared in ethyl acetate was mixed with 4 ml of 0.1 mM of DPPH solution in test tube, mix vigorously by vortex 10 second and the mixture was then leave in dark place for 30 minutes. The reaction was measured absorbance by spectrophotometer at 517nm. (1 ml of ethyl acetate + 4 ml of 0.1 mM of DPPH were used as control and ethyl acetate as a blank)

Percentage of antioxidant activity of each concentration of SCG infused oil samples were plotted in the graph versus with the concentration in order to examine IC50 value from linear equation, compared to ascorbic acid standard curve. Percentage of antioxidant activity and percentage of antioxidant activity increased from carrier oil were calculated by these formulas.

Note : 100 mg/ml SCG infused oil sample was used for calculating percentage of antioxidant activity increased

$$\%Inhibition = \left(\frac{A_b - A_i}{A_b} \right) \times 100$$

A_b = Absorbance blank

A_i = Absorbance infused oil

$$\%Inhibition\ increased\ from\ carrier\ oil = \left(\frac{A_i - A_c}{A_c} \right) \times 100$$

A_c = Absorbance control carrier oil

A_i = Absorbance infused oil

4.3 Color intensity

The SCG infused oil in different oil types were measured color intensity by spectrophotometry technique for determination the percentage of color intensity of SCG infused oils comparing with oil carrier (No SCG). All SCG infused oil samples and oil carrier samples were measured the absorbance at wavelength 420 nm. Percentage of color increased was calculated by this following formula.

$$\%color\ increased\ from\ carrier\ oil = \left(\frac{A_i - A_c}{A_c} \right) \times 100$$

A_c = Absorbance control

A_i = Absorbance infused oil

4.4 Peroxide Value

Peroxide value can be measured by using titration method which shown as concentration of peroxide value (meq/kg). One ml of saturated potassium iodide (KI) was added into prepared oils samples and flask was covered flask with aluminum foil and shakes for 5 min at room temperature. Then 30 ml of distilled water was added and following with the adding of 1 ml of 1% starch solution. The color change into dark brown or dark blue color was observed. After that the mixture was titrated with 0.1 N sodium thiosulphate ($\text{Na}_2\text{O}_3\text{S}_2$) until dark brown or dark blue color disappeared. The volume (ml) of used titrant (0.1N sodium thiosulphate) was recorded and used to calculate peroxide value by this following formula..

$$\text{Peroxide value} = \left[\frac{(V_1 - V_0) \times c}{m} \right] \times 1000$$

V_0 = consumption of 0.1N sodium thiosulphate at initial

V_1 = consumption of 0.1N sodium thiosulphate at the end point

C = molar concentration of sodium thiosulphate

m = weight oils in grams

5. Development of antioxidant glycerin soap bar

The soaps were made by using glycerin soap based, first layer was scrubbed soap which contained SCG as scrub beat and second layer was soap with SCG infused oil.

Glycerin was chopped into small pieces and melted in the double boiler hot water. The 30% w/w SCG infused oils at 120 hrs were used as ingredient to develop the glycerin soap bar as they contained the highest antioxidant activity value. Solid glycerin 50 g was boiled in double boiler hot water and 0.2 g of SCG infused oil was added and mixed gently, after that 2g of dried SCG was added. The mixture was poured into a mold, leave until it cooling. For second layer, 50g of glycerin was melted with boiler and 0.2g of SCG infused oil was added and mixed gently then poured on top of first layer. Wait until the soaps were formed.

6. Preference test

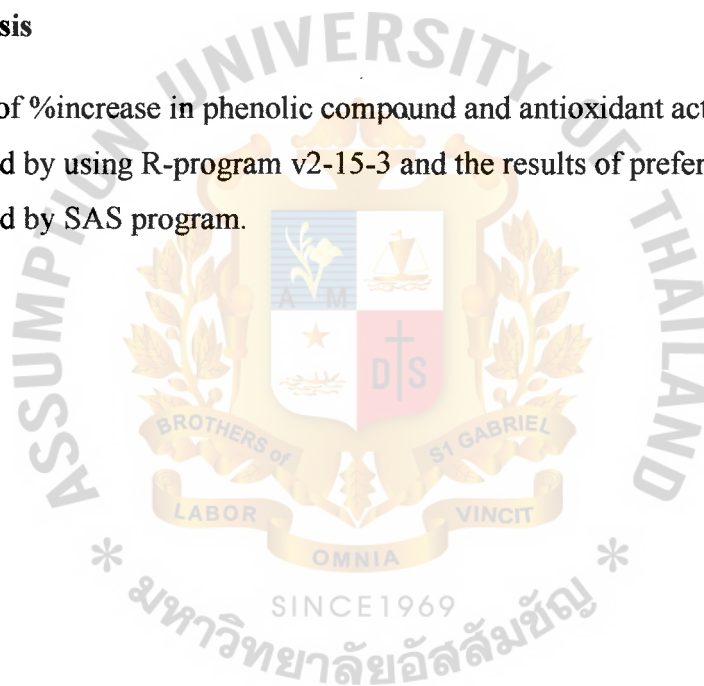

20 panelists were assigned to test the soap with 3 steps

1. Observed the color (transparency) and smell soaps sample and score color and fragrance attributes.
2. Washed hand by using soaps sample, scrubbed soap part on hand until the lathers formed and scrubbed the coffee scrub side on back hand. Then score lather and scrubbing attributes.
3. Rubbed the hands dry and score skin feel and over all liking attributes

The data from preference test was statistically prove by Duncan multiple range test

7. Statistical analysis

The results of %increase in phenolic compound and antioxidant activity were statistically analyzed by using R-program v2-15-3 and the results of preference test were statistically analyzed by SAS program.

CHAPTER IV

RESULTS AND DISCUSSIONS

1. Total Phenolic Compounds in SCG infused oil

Five types of carrier oil (canola oil, corn oil, coconut oil, sunflower oil and mineral oil) were selected for study the effectiveness of the extraction of phenolic compounds from SCG by oil infusion method. Three concentration of SCG infusion in each oil carriers were prepared into 10% (w/w), 20% (w/w) and 30% (w/w) and extracted for 24, 48, 72, 96 and 120 hrs at room temperature. Determination of total phenolic compounds (TPC) in SCG infused oils were done by Folin-Ciocalteu's method and expressed as standard Gallic acid equivalent (mg/ml). The amount of TPC in the carrier oils, various concentration of SCG infused oils were shown in Table 2 and Table 3, respectively.

After oil infusion process, TPC in all oil carriers were increased according to time and concentration ratio of SCG. The highest amount of TPC of non-infused oil (pure oil) was found in canola oil 22.30 ± 0.232 mg/ml, corn oil was 20.02 ± 0.63 mg/ml, sunflower oil was 19.46 ± 0.004 mg/ml, coconut oil was 19.23 ± 0.003 mg/ml and there was no TPC found in mineral oil as shown in Table 2. Mostly, 10% (w/w) and 20% (w/w) infusion ratio at 24 hrs to 72 hrs could showed the development of TPC, however at 96 hrs to 120 hrs of all infusion ratio showed higher amount of TPC, especially for 30% (w/w). By this result, it explained that as more ratio and time of infusion applied, the more TPC absorbed in oil carrier as shown in Table 3.

The percentage development of TPC in all SCG infused oils were determined by comparing to non-infused oils, the result indicated that in all oil sample 30% (w/w) infusion ratio had highest percentage development followed by 20% (w/w) infusion ratio and lowest percentage development is 10% (w/w) infusion ratio.

Table 2 Total phenolic compounds of carrier oils (canola oil, corn oil, coconut oil, sunflower oil and mineral oil

Carrier oil Type	TPC (mg/ml)
Canola	22.30 ± 0.232
Corn	20.02 ± 0.63
Coconut	19.23 ± 0.003
Sunflower	19.46 ± 0.004
Mineral	18.44 ± 0.00

30%		20.06±0.31	20.46±0.12	20.15±0.19	20.41±0.56	22.34±0.68

For canola oil (Figure 5 and Figure 6), at 72 hrs infusion period, TPC in 30% (w/w) infusion ratio had highest percentage development which was $54.78 \pm 4.17\%$ ($36.1 \pm 0.931 \text{ mg/L}$) and TPC decreased at 96 hrs and 120 hrs to $49.57 \pm 5.56\%$ ($33.35 \pm 1.241 \text{ mg/ml}$) and $43.47 \pm 0.28\%$ ($31.990.061 \text{ mg/ml}$), compared to others infusion period. For 20% (w/w) infusion ratio, the percentage TPC increasing developed from 24 to 72 hrs and dropped down at 96 hrs to 15.93 ± 4.17 ($25.85 \pm 0.93 \text{ mg/ml}$) which less than 10% 96 hrs 17.9 ± 0.28 ($26.29 \pm 0.06 \text{ mg/ml}$) however, except 96 hrs infusion time, 20% infusion ratio had higher percentage total phenolic compound increase than 10% infusion ratio.

Figure 5 Total phenolic compounds in Canola oil compared between infusion ratio (10%, 20% and 30% w/w) and infusion period (24 to 120 hrs)

Figure 6 The percentage development of total phenolic compounds in Canola oil in each infusion ratio (10%, 20% and 30% w/w) from 24 to 120 hrs of infusion period

For corn oil (Figure 7 and Figure 8), it was obviously showed that 30% (w/w) infusion ratio had more percentage development of TPC over 10% (w/w) and 20% (w/w) infusion ratio in every period of infusion time. In addition, the percentage development of 10% (w/w) and 20% (w/w) infusion ratio at 120 hrs were a little bit decreased from 96 hrs which were $27.71\pm0.88\%$ (36.26 ± 4.39 mg/ml) to $27.5\pm1.67\%$ (31.37 ± 8.33 mg/ml) for 20% (w/w) infusion ratio and 14.42 ± 5.89 (22.87 ± 1.18 mg/ml) to $13.14\pm5.58\%$ (22.65 ± 1.12 mg/ml) for 10% (w/w) infusion ratio. Moreover, 10% (w/w) infusion ratio had poor TPC compared to others infusion ratio. However, the highest percentage development of total phenolic compound for infused corn oil is $59.4\pm3.89\%$ (35.53 ± 0.87 mg/ml) found in 30% (w/w) infusion ratio at 120 hrs according to table 4.

Figure 7 Total phenolic compounds in Corn oil compared between infusion ratio (10%, 20% and 30% w/w) and infusion period (24 to 120 hrs)

Figure 8 The percentage development of total phenolic compounds in Corn oil in each infusion ratio (10%, 20% and 30% w/w) from 24 to 120 hrs of infusion period

For coconut oil (Figure 9 and Figure 10), the development of TPC of all infusion ratio were significantly different from each other. The TPC in 20% (w/w) infusion ratio was slightly increased from 24hrs to 120 hrs. On the other hands, 30% (w/w) infusion ratio at 96 hrs, the percentage increasing was decreased from 72 hrs infusion period which was $59\pm4.59\%$ (30.57 ± 0.88 mg/ml) to $49.5\pm7.42\%$ (28.75 ± 1.43 mg/ml) as same as 10% (w/w) infusion ratio which was $19.64\pm2.9\%$ (22.87 ± 0.56 mg/ml) to $10.95\pm0.65\%$ (4.17 ± 0 mg/ml). Moreover, at 120 hrs, 10% (w/w) infusion ratio had percentage increasing more than 72 hrs which was $25.32\pm2.26 \%$ (23.5 ± 1.08 mg/ml) but 30% (w/w) infusion ratio was not, $51.1\pm3.87\%$ (29.05 ± 0.74 mg/ml). However, the highest percentage development of TPC for SCG infused coconut oil was $59\pm4.59\%$ (30.57 ± 0.88 mg/ml) which found in 30% (w/w) infusion ratio at 72 hrs as shown in table 3.

Figure 9 Total phenolic compounds in Coconut oil compared between infusion ratio (10%, 20% and 30% w/w) and infusion period (24 to 120 hrs)

Figure 10 The percentage development of total phenolic compounds in Coconut oil in each infusion ratio (10%, 20% and 30% w/w) from 24 to 120 hrs of infusion period

For sunflower oil Figure 11 and Figure 12, the percentage TPC increase in 30% (w/w) infusion ratio was increased from 24 to 120 hrs; $24.94 \pm 2.55\%$ ($24.32 \pm 0.5 \text{ mg/ml}$), $26.97 \pm 1.59\%$ ($24.71 \pm 0.31 \text{ mg/ml}$), $33.73 \pm 4.14\%$ ($26.03 \pm 0.81 \text{ mg/ml}$), $45 \pm 2.87\%$ ($28.22 \pm 0.56 \text{ mg/ml}$), and $56.04 \pm 2.55\%$ ($30.37 \pm 0.5 \text{ mg/ml}$), respectively. For 20% (w/w) infusion ratio, the percentage increasing of TPC was dropped down at 72 hrs $31.25 \pm 1.27\%$ ($25.54 \pm 0.25 \text{ mg/ml}$) to $20.88 \pm 2.07\%$ ($23.53 \pm 0.4 \text{ mg/ml}$) at 96 hrs and increased to $35.01 \pm 0.94\%$ ($26.27 \pm 0.18 \text{ mg/ml}$) at 120 hrs. The 10% (w/w) showed the lowest percentage increasing of TPC compared to others infusion ratio in every period of infusion time. Lastly, the highest percentage development of total phenolic compound for infused sunflower oil was $56.04 \pm 2.55\%$ ($30.37 \pm 0.5 \text{ mg/ml}$) which found in 30% (w/w) infusion ratio at 120 hrs as shown in table 4.

Figure 11 Total phenolic compounds in Sunflower oil compared between infusion ratio (10%, 20% and 30% w/w) and infusion period (24 to 120 hrs)

Figure 12 The percentage development of total phenolic compounds in Sunflower oil in each infusion ratio (10%, 20% and 30% w/w) from 24 to 120 hrs of infusion period

For mineral oil (Figure13 and Figure 14), 10% (w/w) and 20% (w/w) infusion ratio at 24 hrs and 48 hrs showed no development of TPC but at 72 hrs to 120 hrs showed the effectiveness of oil extraction. On the others hand, TPC was detected in every infusion period for 30% (w/w) infusion ratio and had the highest percentage increasing of TPC of mineral oil at 120 hrs which was $22.34 \pm 0.68\%$ (22.04 ± 0.72 mg/ml) as shown in Table 4.

Figure 13 Total phenolic compounds in Mineral oil compared between infusion ratio (10%, 20% and 30% w/w) and infusion period (24 to 120 hrs)

Figure 14 The percentage development of total phenolic compounds in Mineral oil in each infusion ratio (10%, 20% and 30% w/w) from 24 to 120 hrs of infusion period

After comparing the percentage of development of total phenolic compound in each period of infusion (24, 48, 72, 96 and 120 hrs), the ratio of infusion oils had influence the extracted amount of TPC in the oil infusion process. The 30% (w/w) infusion ratio showed the highest percentage of TPC development, followed by 20% (w/w) infusion ratio and the lowest was 10% (w/w) infusion ratio. The highest percentage development of TPC was found in SCG infused corm oil at 30% (w/w) infusion ratio, 120 hrs

The comparison between 30% (w/w) infusion ratio of all carrier oils samples, as 30% (w/w) infusion ratio had more percentage development of phenolic compound than others ratio, so this ratio was selected to compare between each type of oil carriers.

In Figure 15, coconut carrier oil showed highest percentage development of TPC in 24, 48 and 72 hrs infusion times, canola carrier oil showed the highest percentage development TPC at 96 hrs, corn carrier oil showed the highest percentage development TPC at 120 hrs. Every carrier oils had potential to extract TPC from SCG though infusion process. In addition, the phenolic compound in initial oils carrier had influent to amount of extracted TPC after infusion process which the TPC could be absorbed well if less TPC contented in initial oil carrier like mineral oil, corn oil and sunflower oil.

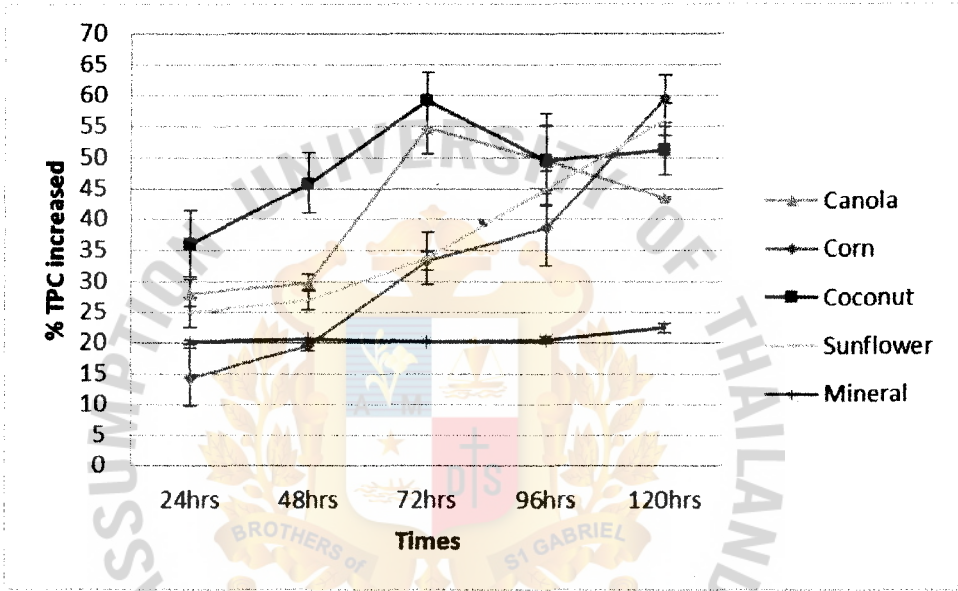

Figure 15 The percentage increasing of total phenolic compound compared with oil carrier from 24 to 120 hrs, in 30% (w/w) infusion ratio

From the previous study of extraction phenolic compound antioxidant by oil infusion, Rosemary and Oregano were used as herbal materials infused in olive oil. Total polar phenol content in oregano flavoured oils increased about 3.5 times in comparison with that of the control. For the rosemary flavoured oil an increase of 1.7 times was observed. Besides this peroxide value changes were higher for Oregano flavoured oil compared with Rosemary, both were higher than the control sample. In addition, there were development of pigment from Pheophytin α , β -Carotene and Lutein, oregano was higher than Rosemary. (Mayada Damechki, 2001).

2. Anti-oxidation activity by DPPH scavenging method

The antioxidant activity of SCG infused oil was measured by DPPH scavenging assay. Table 5 indicated the antioxidant activity of all oil carriers before adding SCG in the oil infusion process, the highest antioxidant activity was found in sunflower oil (90.5%) and the antioxidant activity in the other oil carriers were canola oil (89.7%), corn oil (74.9), coconut oil (13.4%) and the lowest was mineral oil (4.3%).

The antioxidant activity of SCG infused in the various types of oil carriers were also determined as shown in Table 6. Furthermore, the percentage of antioxidant activity increased from oil carrier was also studies and showed in Table 7.

Table 5 The percentage antioxidant activity of oil carriers by DPPH scavenging

Type of Oil carriers	% antioxidant activity
canola	89.7±0.77
corn	74.9±1.44
coconut	13.4±1.25
sunflower	90.5±0.87
mineral	4.3±1.07

For canola oil as shown in figure 16, the antioxidant activity in oil carrier was higher than 20% (w/w) and 10% (w/w) infusion ratio in every period of infusion time and also higher than 30% (w/w) infusion ratio at 24 hrs. At 48 to 120 hrs, it was obviously found that the antioxidant activity of 30% (w/w) infusion ratio was more than oil carrier. The highest percentage of antioxidant activity of SCG infused oil increased from oil carrier was observed in 30% (w/w) at 120 hrs that indicated $92.31\% \pm 1.1$ increasing shown in Table 7 and Figure 17. According to Figure 5, the TPC in 20% (w/w) and 10% (w/w) infusion ratio were higher than carrier oil which is unrelated with lesser antioxidant activities performed by DPPH method. By these results, the 20% (w/w) and 10% (w/w) infusion ratio of oils and spent coffee ground was not promoted antioxidant activity. However, 30% (w/w) infusion ratio showed the increasing of antioxidant activity started from 48 hrs to 120 hrs. In addition, the antioxidant activity of SCG infused canola oil in each period of infusion time were increased significantly by more infusion ratio applied. In Figure 17, the increasing of percentage antioxidant activity was only found in 30% infusion ratio from 48 to 120 hrs which had the highest value of $2.91 \pm 1.2\%$ at 120 hours infusion ratio.

Figure 16 The percentage inhibition of DPPH scavenging assay in canola oil compare between infusion ratio (10%, 20% and 30% w/w) and infusion period (24, 48, 72, 96 and 120 hours)

Figure 17 The percentage inhibition increased from carrier oil in canola oil in each infused ratio (10%, 20% and 30%) from 24 hours to 120 hours infusion period

For corn oil (Figure 18), corn oil carrier had more antioxidant activity than all SCG infusion ratios [10% (w/w), 20% (w/w) and 30% (w/w)] at 24 hrs. At 48 hours, pure oil also had higher percentage inhibition over 10% (w/w) infusion ratio but, less than 20% (w/w) and 30% (w/w) infusion ratio. However, the highest percentage inhibition of infused corn oil was $91.25 \pm 1.9\%$ found in 30% (w/w) infusion ratio at 120 hours. According to Figure 7 The lowest phenolic compound was found in carrier oil. In addition, all infusion ratio in corn oil showed the increasing in percentage inhibition relatedly with more in fusion period applied and all in fusion period the percentage inhibition also increased relatedly with infusion ratio. In Figure 19, at 24 hour there was no increasing in percentage antioxidant activity in 10% (w/w) and 20% (w/w) infusion ratios. On the other hand, 30% (w/w) infusion ratio showed higher percentage increased over other ratios in every period of infusion time and the highest value was $21.84 \pm 1.9\%$.

Figure 18 The percentage inhibition of DPPH scavenging assay in corn oil compare between infusion ratio (10%, 20% and 30% w/w) and infusion period (24, 48, 72, 96 and 120 hours)

Figure 19 The percentage inhibition increased from carrier oil in corn oil in each infused ratio (10%, 20% and 30%) from 24 heures to 120 hours infusion period

For coconut oil in (Figure 20), it was obviously found that antioxidant activity of all infusion ratios at every period of infusion were higher than coconut oil carrier, besides this all infusion ratio in coconut oil had the increasing in percentage antioxidant activity relatedly with more in fusion period applied and all in fusion period the percentage inhibition also increased relatedly with infusion ratio (Figure 21). The highest percentage antioxidant activity of SCG infused coconut oil was $48.94\pm0.4\%$ in 30% (w/w, 120 hrs. According to its TPC in figure 9, antioxidant activity was increasing except 10% (w/w) and 30% (w/w) infusion ratio at 72 hrs which higher in TPC than 96 hrs infusion period but lower in percentage inhibition of DPPH scavenging assay. Figure 21 indicated the increasing in percentage antioxidant activity in all infused SCG infused coconut oil samples especially the highest percentage in 30% (w/w) at 120 hrs $265.23\pm5.8\%$.

Figure 20 The percentage inhibition of DPPH scavenging assay in coconut oil compare between infusion ratio (10%, 20% and 30% w/w) and infusion period (24, 48, 72, 96 and 120 hours)

Figure 21 The percentage inhibition increased from carrier oil in coconut oil in each infused ratio (10%, 20% and 30%) from 24 hours to 120 hours infusion period

For sunflower oil (Figure 22), oil carrier contained the antioxidant activity higher than 10% (w/w) SCG infused oil at 24, 48, 72, 96 hrs, 20% (w/w) and 30% (w/w) at 24 hrs. In addition all 3 of infusion ratio had the sharply increasing of antioxidant activity at 48 hrs from 24 hrs whereas during 48, 72 and 96 hrs had not changing much (Figure 23). The highest percentage of antioxidant activity was found in the 120 hrs infusion time period which 30% SCG infused sunflower oil showed $94.71 \pm 0.3\%$. According to Figure 11, carrier oil had lowest phenolic compound which unrelated with percentage inhibition of DPPH scavenging assay. Figure 23 showed that 10% (w/w) and 20% (w/w) infusion ratios antioxidant activity were increased only at 120 hrs whereas 30% (w/w) was increased from 48 to 120 hrs. So, 30% (w/w) at 120 hrs had the highest value of $4.65 \pm 4.6\%$.

Figure 22 The percentage inhibition of DPPH scavenging assay in sunflower oil compare between infusion ratio (10%, 20% and 30% w/w) and infusion period (24, 48, 72, 96 and 120 hours)

Figure 23 The percentage inhibition increased from carrier oil in sunflower oil in each infused ratio (10%, 20% and 30%) from 24 hours to 120 hours infusion period

For mineral oil as shown in Figure 24 and Figure 25, the antioxidant activity in carrier oil was higher than 10% (w/w) and 20%(w/w) infusion ratio and there was no significant different with 30% (w/w) infusion ratio at 24 hrs. In 10% (w/w) and 20% (w/w) infusion ratio at 72 hrs, the percentage antioxidant activity was sharply increased from 48 hrs and a little bit decreased at 96 hrs and increased again at 120 hrs. On the others hand, 30% (w/w) infusion ratio at 48 hrs, the percentage inhibition was shapely increased from 24 hrs and slightly increased from 48 hours to 120 hrs. The highest percentage inhibition of infused mineral oil was $10.51\pm0.4\%$ found in 30% (w/w) infusion ratio at 120 hours. According to Figure13, there was no TPC in carrier oil so, the antioxidant activity in mineral not come from TPC's itself. In mineral oil, there are some chemicals adding in order to prevent oil itself from oxidation reaction and deterioration Figure 25 showed no increasing of percentage antioxidant activity in 10% (w/w) and 20% (w/w) infusion ratios. The 30% (w/w) infusion ratio at 120 hrs indicated the highest percentage antioxidant activity increased at $144.41\pm10.4\%$.

Figure 24 The percentage inhibition of DPPH scavenging assay in mineral oil compare between infusion ratio (10%, 20% and 30% w/w) and infusion period (24, 48, 72, 96 and 120 hours)

Figure 25 The percentage inhibition increased from carrier oil in mineral oil in each infuse ratio (10%, 20% and 30%) from 24 hours to 120 hours infusion period

Figure26 was the comparison between all SCG infused in five different oils at 30% (w/w) infusion ratio, coconut oil infused with SCG had the highest percentage increasing of percent inhibition followed by mineral oil, corn oil, sunflower oil and canola oil, respectively.

Figure 26 The increasing of percentage inhibition of DPPH scavenging assay from carrier oils in 30%(w/w) infusion ratio from 24 to 120 hours compare between each oils carrier

The result of IC50 was shown in Table 8, IC50 is the inhibition concentration at 50% according to the percentage inhibition, 30% infused sunflower oil at 120 hours exhibited strong antioxidant DPPH radical scavenging activity with the IC50 value of 29.07 mg/ml which had the highest percentage inhibition (94.71%±0.3) In addition, the other SCG infusion in canola and corn oils also exhibited the strong antioxidant activity as the IC 50 value were 27.93 mg/ml and 27.36 mg/ml, respectively. However, the standard ascorbic acid contained IC50 value of 2.97 mg/ml.

Table 8 the inhibition concentration of DPPH scavenging assay at 50% (IC50) in 30% (w/w) infusion ratio from 24 hours to 120hours in each oil

IC50 (mg/ml)						
Oil type	oil carrier	24hours	48hours	72hours	96hours	120hours

Mineral	3,125.25	4,195.03	1,016.46	706.67	1,408.62	834.07

Note : IC 50 of ascorbic acid = 2.97mg/ml

3. Color intensity

The color of SCG infused oils were measured the absorbance by spectrophotometry method. The maximumwavelength was selected at 420 nm which suitable to observe the range of yellow color. The percentage increasing of color of all SCG infused oils were determined based on color of carrier oils (Table 9).

Table 10 and Table 11 showed the percentage increasing of color in oil after passed infusion process, the highest percentage increasing of color was found in coconut oil, which very different from the others.

Table 9 The measurement of color intensity of oil carrier at 420 nm

Carrier oil	Absorbance value at 420 nm
canola	0.196±0.01
corn	0.426±0.015
coconut	0.014±0.005
sunflower	0.072±0.004
mineral	0±0

For canola oil, in Table 11 and Figure 27, the percentage increasing of color related with infusion time, the highest percentage increasing of color in canola oil found in 30% (w/w) infusion ratio at 120 hours which is 0.8% (10^3). It was showed that the comparison of percentage increasing of color of canola oil in each infusion ratio, 30% (w/w) infusion ratio showed highest percentage increasing of color in every infusion period followed by 20% (w/w) and 10% (w/w) infusion ratio.

Figure 27 The percentage of color increasing compare to canola oil carrier in each SCG infused ratio (10%, 20% and 30% (w/w)) from 24 hours to 120 hours

For corn oil (Figure28), the 20% (w/w) and 10% (w/w) infusion ratios showed the percentage increasing of color had increase related with infusion time but, for 30% (w/w) infusion ratio at 48 hours was decreased from 24 hours, which is 0.17% (10^3) to 1.4% (10^3) and increased to 0.26% (10^3) at 72 hours. The highest percentage increasing of color in corn oil found in 30% (w/w) infusion ratio at 120 hours which is 0.34% (10^3) It was showed that the comparison of percentage increasing of color of corn oil in each infusion ratio, 30% (w/w) infusion ratio showed highest percentage increasing of color in every infusion period followed by 20% (w/w) and 10% (w/w) infusion ratio.

Figure 28 The percentage of color increasing compare to corn oil carrier in each SCG infused ratio (10%, 20% and 30% (w/w)) from 24 hours to 120 hours

For coconut oil, it was obviously found that coconut oil had highest percentage increasing of color compared to others oil carriers. As shown in Table 11 and Figure 29, the percentage increasing of color had increase related with infusion time, the highest percentage increasing of color in canola oil was 11.97% (10^3) which found in 30% (w/w) infusion ratio at 120 hours). Figure 29 showed the comparison of percentage increasing of color of corn oil in each infusion ratio, 30% (w/w) infusion ratio showed highest percentage increasing of color in every infusion period followed by 20% (w/w) and 10% (w/w) infusion ratio.

Figure 29 The percentage of color increasing compare to coconut oil carrier in each SCG infused ratio (10%, 20% and 30% (w/w)) from 24 hours to 120 hours

For sunflower oil, the percentage increasing of color had increase related with infusion time, the highest percentage increasing of color in sunflower oil found in 30% (w/w) infusion ratio at 120 hours which is 2.04% (10^3). In Figure 30, it indicated that the comparison of percentage increasing of color of canola oil in each infusion ratio, 30% (w/w) infusion ratio showed highest percentage increasing of color in every infusion period followed by 20% (w/w) and 10% (w/w) infusion ratio.

Figure 30 The percentage of color increasing compare to sunflower oil carrier in each SCG infused ratio (10%, 20% and 30% (w/w)) from 24 hours to 120 hours

For mineral oil, it had lowest percentage increasing of color compared to others oil carriers. In Table 11 and Figure 31, the percentage increasing of color had increase related with infusion time, the highest percentage increasing of color in canola oil found in 30% (w/w) infusion ratio at 120 hours which is 0.074% (10^3). In Figure 31 Showed the comparison of percentage increasing of color of canola oil in each infusion ratio, 30% (w/w) infusion ratio showed highest percentage increasing of color in every infusion period followed by 20% (w/w) and 10% (w/w) infusion ratio

Figure 31 The percentage of color increasing compare to mineral oil carrier in each SCG infused ratio (10%, 20% and 30% (w/w)) from 24 hours to 120 hours

4. Peroxide value

Peroxide value of carrier oils and infused oils were determined by iodometric titration method. 30% ratio infusion at 120hours of all carrier oils was selected to use as samples, due to their phenolic compounds and antioxidant activities. The used of titrant volumes (0.1N sodium thiosulphate) were used for calculation of peroxide value in unit of milliequivalent/kilograms (meq/kg). The peroxide value of canola, corn. Coconut, sunflower and mineral oil were 10, 4, 2, 22, and 0 meq/kg, respectively (Table 12).

After infusion process, there were three types of oil carrier that had development in peroxide value which were canola oil from 10 to 16meq/kg, corn oil from 4 to 8meq/kg, sunflower oil from 22 to 36. From the result, it was obvious that sunflower oil had highest peroxide value 36meq/kg. Corn oil had highest percentage peroxide value increased from carrier oil 100%. Spent coffee grounds were not promoted inhibition of peroxide value in these carrier oils or acidity in coffee itself induced the oxidation to the carrier oils.

For coconut oil, there was not changing in peroxide value after infusion process. The reason was coconut oil was consist of saturated fatty acid which was the stable from of fatty acid and harder to oxidize than unsaturated fatty acid. And peroxide value in mineral oil was not found because it distilled from petroleum and did not have fatty acid to oxidize with oxygen.

Table 12 Peroxide value of carrier oils, SCG infused oils (30%(w/w)/120hours) and percentage peroxide value increase from carrier oil.

Peroxide Value(meq/kg)			
infused oil	carrier oil	30%(w/w)/120hours	% POV increased from pure oil
	POV	POV	
canola	10	16	60
corn	4	8	100
coconut	2	2	0
sunflower	22	36	63.64
mineral	0	0	0

5. Antioxidant soap bar with coffee scrub

5.1 Preference test

After infused oils used as essential oils for making glycerin soap. In addition, non-added glycerin soap was used as control, total of sample soaps were six types, they were graded liking score range from 1-9 based on panelists' preferences on these following attribute; color(transparency), fragrance, lather, moisturizing, scrubbing, skin feel and over all liking.

The data from preference test was statistically prove by Duncan multiple range test

Table13: preference scores of each type of infused oils soaps on seven attributes

Attributes	Oils					
	Canola	Corn	Coconut	Sunflower	Mineral	Control
Color	6.05±1.00 ^b	5.95±0.76 ^b	6.35±1.23 ^b	6.45±1.00 ^b	6.35±1.31 ^b	7.35±1.09 ^a
Fragrance	5.95±1.70 ^a	6±1.26 ^a	6.2±1.54 ^a	5.3±1.84 ^b	6.3±1.42 ^a	6.35±1.79 ^a
Lather	6.3±1.59 ^{ab}	6.2±1.79 ^b	6.55±1.54 ^{ab}	7.1±0.72 ^{ab}	6.6±1.23 ^{ab}	7.2±1.54 ^a
moisturizing	6.5±1.15 ^{ns}	6.25±1.29 ^{ns}	6.65±1.09 ^{ns}	6.2±1.32 ^{ns}	6.75±1.16 ^{ns}	6.65±1.35 ^{ns}
scrubbing	6.2±1.40 ^{ns}	6.05±1.64 ^{ns}	6.5±1.61 ^{ns}	6.65±1.27 ^{ns}	6.35±1.87 ^{ns}	6.9±1.52 ^{ns}
Skin feel	6.55±1.10 ^{ab}	6.4±1.14 ^{ab}	6.55±1.36 ^{ab}	6.3±1.26 ^b	6.75±1.16 ^{ab}	7.1±1.33 ^a
Over all liking	6.8±0.83 ^{ab}	6.65±0.93 ^{ab}	6.75±1.02 ^{ab}	6.55±1.00 ^b	6.95±0.94 ^{ab}	7.3±1.45 ^a

Remark: ^{a b} means with superscripts in the column and those without a common superscript were significantly different α=0.05. ^{ns} superscript means no significantly different α=0.05

From the results, there were no significantly different between each oil on these attributes; moisturizing and scrubbing. For color, control had highest score 7.35 ± 1.09 significantly different from others soaps sample. For fragrance, infused sunflower oil soap had lowest score 5.3 ± 1.84 significantly different from others soaps sample. For lather, control had 7.2 ± 1.54 higher score than 6.2 ± 1.79 infused corn oil soap significantly. For skin feel and over all liking, control had significantly higher scores than infused sunflower oil soap, 7.1 ± 1.33 to 6.3 ± 1.26 and 7.3 ± 1.45 to 6.55 ± 1.00 , respectively.

5.2. Survey Questions

One hundred people were assigned to do survey questions for antioxidant glycerin soap bar with coffee scrub.

From the result, 62% were female and 38% were male. 35% of respondents were range between 41-50 years old and 23% were 51-60 years old. People who used soap bar and liquid soap were separated half by half which were 49% and 48%, respectively. Lux was the most used brand 26.3% followed by Shokubutsu 17.9% and Protex 14.7%. 30% of respondents had been using the same brand over 3 years, 17% had been using between 1 to 2 years and 16% had been using lower than 3 months. Fragrance was considered to be the most important attribute for respondents meanwhile other attributes were in range of important level. 58% of respondents did not know antioxidant soap but, 57% used to use scrub which most of natural scrubbers were rice (36.1%) and coffee (36.1%).

Lastly, 55.6% were not decided to purchase antioxidant glycerin soap bar with coffee scrub product yet, 31.3% were decided to purchase product meanwhile only 13.1% were not response to this product. However, 55.6% was more than half of respondents that might or might not purchase the product which challenged to make them purchase product by marketing plans and development of product.

CHAPTER 5

Conclusion

1. Infusion method was successfully to extract the phenolic compounds from spent coffee ground. Moreover, as the more infusion ratio and time increased, the more TPC and antioxidant activity develop from carrier oils
2. The highest TPC in SCG infused oil found in 30% (w/w) at 72 hours as 36.1 ± 0.93 mg/ml and highest % inhibition is $94.71\% \pm 0.3$ found in 30% w/w SCG infused sunflower oil at 120 hours.
3. Peroxide value increased in canola oil, corn oil and sunflower oil after oil infusion method whereas unchanged in coconut oil and not found in mineral oil
4. 30%(w/w) SCG infused sunflower oil at 120 hours was considered as the best infused oil to develop antioxidant soap due to antioxidant activity and result from preference test

Model	24	105.3000000	4.3875000	2.29	0.0025
Error	95	182.2916667	1.9188596		
Corrected Total	119	287.5916667			

R-Square	Coeff Var	Root MSE	scrubbing Mean
0.366144	21.50420	1.385229	6.441667

Source	DF	Anova SS	Mean Square	F Value	Pr > F
Block	19	95.75833333	5.03991228	2.63	0.0011
Treatment	5	9.54166667	1.90833333	0.99	0.4254

Randomized Complete Block

The ANOVA Procedure

Duncan's Multiple Range Test for scrubbing

Alpha	0.05
Error Degrees of Freedom	95
Error Mean Square	1.91886

Number of Means	2	3	4	5	6
Critical Range	.8696	.9151	.9453	.9675	.9846

Means with the same letter
are not significantly different.
