

## ABSTRACT

The system development project was developed to enhance the productivity and improve the efficiency of Air-condition Store. The emphasis is on computerization of Order Processing Control System for the construction business. At present the system is done manually which causes many problems such as the delay in transportation the material. Each department has to use their own database which are kept separately in different format. Therefore, the data are inconsistent, yet, summary reports and ad-hoc queries cannot be provided to the management on timely basis. The Order Processing Control System for Air-condition Store will increase the efficiency of internal workflow in store department, accounting department, decrease the time and complexity of working process and finally it will provide the competitive advantage to the company.
