

ABSTRACT

This report is a part of CS 6998 System Development Project. Its main purpose is to present a better basis for understanding the area of powerful designing tools to help develop the Information System Design phase. Moreover, Structured System Design tools, Structured Chart and Module Specification are added progressively by the use of system partitioning into manageable subsystems so that programmer can perform coding of each module independently and effectively. This system analysis project is to study the needs in their day to day working operations to fully understand the needs the company has for its computer system. It includes discussions and interviews with staff at varying levels in the company to ensure that all the staff have the opportunity to contribute their needs, desires, ideas and thoughts. These gave me goals to achieve the finished system which could successfully satisfy and fulfill their requirements.
