

ABSTRACT

A Satellite Image Information System is the Satellite Information for remote sensing business, is designed to provide the data consistency on a timely information as it will leverage information system to achieve a competitive archiving that ultimately leads to increase profitability and will serve as an integral part of information service to the management.

At the present time, There are a lot of user requirements, to order the satellite data, to produce order form for ground receiving station and photo lab. More satellites, more datas, not good database design then more difficulties to management on a timely basis.

The area under study of this system includes satellite information, user services record and report generation. The major reports produced user information, order report, product report and analysis report which will be an effect tool for decision making and study the trend of the satellite information on such application.
