

ABSTRACT

The Billing System Development Project was developed to improve the existing functions at THAI Consultants Group. Presently all functions of the system are operated manually which could not produce timely and accurate data. The use of a modern, computerized billing system has proven to be an important part of this on-going race with the competition.

The proposed system was designed to help improve the manual operation. The tools of structured analysis such as context diagram, data flow diagram, and data dictionary are used for the analysis phase. The Software Package is chosen to solve this problem.

The new system serves the operating function and is made user friendly. The user can provide input, process the data, and generate the results more quickly and efficiently.
