

ABSTRACT

This project concerns with the possible solutions to the existing system's problems occurred within the particular audio accessories manufacturing industry's system, Zing Audio Manufacturing Industry. According to the existing system, its entire business' functions have been recently manually done. Therefore, there exists a great number of inevitable problems. The suggested solution for all those existing problems is to apply the computerized information system.

After the existing system activity's surveyed and analyzed, according to the information life cycle methodologies, two possible candidate solutions have been proposed to this system: the valuable and the centralized solution. From these solutions the second alternative has been chosen: the centralized solution.

Within this second alternative, the new proposed system will not rely heavily on the new information system technology; instead, it will begin to demonstrate the convenience of having the computerized system in order to facilitate the end user in memorizing the essential information of the business and to enhance the daily business activities. This candidate suggests that the information center will be constructed and be merged with the manager's bureau. Any other personnel apart from this computer center will obtain permission only to carry the document to this center in order to insert or obtain some necessary information into or out of the system.

Further activity after this project implementation is to extend to reliably integrate the real information system technology into this implemented system as soon as the personnel are familiar to the computerized system.
