

## ABSTRACT

The nature of fashion, particularly in footwear sector, is known as the strongly competitive scheme. It is found that the fashion has rapidly updated day-by-day. This competitive characteristics of fashion scheme has encouraged the footwear retailer to seek a better solution for enabling the simple procurement processes such as developing more cost effective methods, implementing a computerized inventory system, which include handling and storage system. CG Footwear Shop also realizes the needs to replace the current manual system with computerized system, so it has developed Footwear Retailer Information System to respond to those requirements. This new program has rapidly and correctly activated the users in operating the business process flow, reducing the redundant workflow and daily tasks, reducing the workforce, and decreasing the human errors.
