The Order Processing Information System for Chaiwat Electric Company

by Mr. Chaiwat Eikarat

A Final Report of the Three-Credit Course CS 6998 System Development Project

Submitted in Partial Fulfillment of the Requirements for the Degree of Master of Science in Computer Information Systems Assumption University

August 2001

Project Title	The Order Processing Information System for Chaiwat Electric Company
Name	Mr. Chaiwat Eikarat
Project Advisor	Air Marshal Dr. Chulit Meesajjee
Academic Year	August 4, 2001

The Graduate School of Assumption University has approved this final report of the three-credit course, CS 6998 System Development Project, submitted in partial fulfillment of the requirements for the degree of Master of Science in Computer Information Systems.

Approval Committee: <u>AM chult Messajjee</u> (Air Marshal Dr. Chulit Meesajjee) Dean and Advisor (Prof.Dr. Srisakdi Charmonman) Chairman

Viehil Arteh (

(Asst.Prof.Dr. Vichit Avatchanakorn) Member

(Assoc.Prof. Somchai Thayarnyong) MUA Representative

ABSTRACT

The Order Processing Information System is developed based on Sales Department at Chaiwat Electric Company. The information is gathered from the department daily operations. This Project covers the analysis of the existing system and proposed system.

The current existing Order Processing Information System is based on the manual and some computerized system. Most data are stored on paper, while some parts are kept in the Microsoft Access. It is very hard to maintain the system, that has to face the general problems of manual system, which are error-prone and having a high maintenance cost.

The new proposed Information System will be developed to replace the manual and some computerized information system. All data are kept in the database server, Microsoft SQL Server 7.0, and are accessed through the web server, Microsoft Internet Information Server 5.0 on Microsoft Windows 2000 Server. The user interfaces, moreover, are implemented on web browser, Microsoft Internet Explorer. It will reduce the number of administrative staffs, solve the problem of manual system and decrease the high maintenance cost.

i

ACKNOWLEDGEMENTS

It is a great pleasure to acknowledge the assistance and guidance of numerous people who contributed to this system development project and making the report success.

The writer would like to thank Air Marshal Dr. Chulit Meesajjee, his project advisor, for advising him thought out these project.

Thank to all MS(CIS) instructors for the knowledge they gave him through out his study in CIS program.

Lastly, he would like to thank Sales Department for providing him the necessary information that he uses to develop this project.

I. INTRODUCTION

1.1 Background of the Project

In the past, the company used computer for basic tasks such as preparing documentation and keeping records of customer and business partners. In addition the existing order system make errors occur and it easily delayed in the past. To reduce all these problems, we decide to use the computer system to execute the job.

The order processing information system is aimed to develop a computerized information system in order to support data collection for higher efficiency in responding and satisfying in terms of the attached diagram. Finally, this project suggests a system that will enhance the business functions in terms of capacity and control by using a computerized web database gathering and containing all necessary information that is related to the data collecting. We aim to help employees in gathering information from the customers and store them into computerized web base format in order to let every concerned departments easily retrieve the desired data.

1.2 Objectives of the Project

The objective of the project on order processing information system are as follows:

- To reduce documentation work by adopting documents electronically such as purchase order, invoice., etc.
- (2) To reduce the transaction and processing cost.
- (3) To enable shorten lead-time of ordering components in order to meet the requirement of the customers.
- (4) To implement the new system which provides high speed of data transmission & communication and improve the accuracy of information.

1.3 Scope of the Project

This project focuses on computerized system of how to increase efficiency of various activities at station service and reduce the time taken to serve customers to achieve their satisfaction.

The project scope is divided as follows:

- (1) Scope of Data
 - (a) Purchase order number (P/O#)
 - (b) Customer code
 - (c) Order type
 - (d) Currency paid by the customer
 - (e) Price term for customer purchase order
 - (f) Date of customer order / delivery date
 - (g) Sales contact
 - (h) Quantity ordered
 - (i) VAT
 - (j) Name of suppliers for the goods
 - (k) Specification of the goods (Model, Unit Price, etc)
- (2) Scope of Process
 - (a) The company receives order from customer by telephone or e-mail.
 - (b) The company input data of customer into customer's web based application of classifying the type of customer.
 - (c) The company input the information about the customer purchase order.
 - (d) The information is automatically link to the supplier's customer system.

- (e) The supplier sends Purchase Invoice, Bill of Lading and other related business documents to the company through the network.
- (f) The company receives P/L, B/L and other related business documents via electronically devices.
- (g) The company receives and clears merchandise at cargo (or) received by the customer.
- (3) Scope of Interface
 - (a) Customer
 - (b) Model
 - (c) Model Price
 - (d) Customer Purchase Order
 - (e) Company Purchase Order
 - (f) Control P/A Shipment
 - (g) Delivery Order
 - (h) Stock In
 - (i) Stock Out
- (4) Scope of Geography
 - (a) The Chaiwat Electric Company
 - (b) The company's suppliers are established in Japan, Singapore, Malaysia, Philippines and Indonesia

In summary, the context data flow diagram of gas self-servicing real time information system is illustrated in Figure F.1.

1.4 Deliverables

- (1) Project Introduction
 - (a) Background of the project

- (b) Objectives
- (c) Scope
- (2) The Existing System
 - (a) Background of the organization
 - (b) Existing business function
 - (c) Current problems and areas for improvements
 - (d) Existing computer system
- (3) The Proposed System
 - (a) System specification
 - (1) Context diagram
 - (2) Data flow diagram
 - (b) System design
 - (c) Hardware and software requirement
 - (d) Security and controls
 - (e) Cost/benefit analysis
- (4) Project Implementation SINCE 1969
 - (a) Overview of project implementation
 - (b) Test plan and results
- (5) Conclusions and Recommendations

1.5 Project Plan

The project plan is represented in Gantt Chart as shown in Figure 1.1.:

S

II. THE EXISTING SYSTEM

2.1 Organization Background

Chaiwat Electric Company was founded on 23 April, 1997. The company engaged in providing the component part including electronic components, home appliance & communication components, car electronic products, semiconductor and factory automation from the Chaiwat group who are the suppliers established in Japan, Singapore, Malaysia, Philippines and Indonesia to customers. The company sells imported and local industrial products in Thailand. The shareholders of the company are Chaiwat Electric Company which holds 49% and Nattapong Electric Company which holds 51% of the total stock. The company has approximately 114 people in the organization.

Chaiwat Electric Company has a clear-cut duty divided into each department. Description of each department are as below:

(1) Sales Department:

The department promote, advertise and sale products of the company and handles all orders from all customers that the customers ordered.

(2) Logistic Department:

The department is handling import cargoes and responsible for taking care of stock of cargoes stored in warehouses.

(3) Accounting Department:

The department deals with all jobs such as making general accounting standard, producing payroll for all employees and support internal activities for sales' job.

(4) Human Resource Department:

The department is responsible for everything about staff- such as: recruiting employee, etc.

The organization chart of Chaiwat Electric Company is shown below in Figure 2.1.

Figure 2.1. The Organization Chart of Chaiwat Electric Company.

2.2 Existing Business Functions

The Sales department receives purchase orders from customers then they will check and verify the customer's business documents manually and submit to the authorized person for approval. It will take 3-5 days for the business documents to pass for approval. If it is approved, they will send them to the company's suppliers established in foreign countries via fax machines and sometimes by mailing the business document. For keeping the records of each customer, the company classifies the customer's records in more than one file, which can frustrate the information worker. From the supplier's side, it will take time to check and verify business documents sent from the company. It also consumes time to provide the goods for the company since it will check the stock of the components for each customer. Because his company lacks linking its business to be as one organization, many disadvantages occurred to the company.

2.3 Current Problems and Areas for Improvement

Ordering some products from suppliers established in foreign countries brought the cost of transaction each time high and communication channel itself made it difficult to know the product availability at the moment. A lot of business document had to be used and the complexity of passing each transaction to the authorization department takes about 3-5 days for checking and approval.

Implementing the new system – VPN (Virtual Private Network) which is a service offer secure, reliable connectivity over shared public network infrastructure such as the internet. Introducing VPN the Sales department would check and issue the purchase order from customer. Instead of printing and mailing to the suppliers established in foreign countries, the purchase order would be transmitted directly to the suppliers in foreign countries via computer network.

To facilitates this process, we adopt order processing information system software to transmit the related information to the supplier. On the supplier's side suppliers could send their business documents such as shipping document, invoice, or related documents through the network within less than a minute. In addition, to achieve the global competitiveness in the business world, the company needs linking all business partners together to know their up-to-date information.

2.4 Existing Computer System

At present, our company has some information system to support the business. Some information may be kept in the form of paper work that has opportunity to lose any information used to record the business report and some information may be kept in Microsoft Access Database. Moreover, information is not easily shared to any responsible person or division to perform some tasks. So, it is a time to develop and implement the new system to better performance of the business.

III. THE PROPOSED SYSTEM

3.1 System Specification

The new system is developed by Visual InterDev and it is analyzed and designed by the following tool;

Context Diagrams

They are constructed to show the highest level model of the system. This is the most general or broad picture of the existing system. They are used to represent pictorially the scope of boundaries of the system or what we call the area under study. Their purpose is to identify what is to be included in the area under study. They link the system to the rest of the world. It shows how the system interacted with the others outside the system boundary. In other words, it intends to obtain a broad overview of what the system encompasses and what it does not encompass.

Data Flow Diagrams

They are graphic representation of a system that shows data flows to, from, and within the system, processing functions that change the data in some manner, and the storage of this data they are nothing more than a network of related system function (processing of data) that indicated from where information is received and where it is sent a popular term of data flow diagram refer to acronym DFDs.

3.2 System Design

After getting the best evaluate alternate solution to fulfill our business requirements and specify the computer base solution, the design and integrate requirements is involved to develop technical design specifications. That means our identified system analyst ready to be constructed.

MS (CIS) St. Gabriel Library, Au

1840 0.1

By constructing the propose system, the technical design specifications (IS blueprints) are identified into 5 distinct focus in the system, which are the processes to be illustrated; a system designed by orderly drawing process design, database design, input and output design, user interface, and software design. The pictures are shown in Appendix section.

(1) Process Design

The process design is depicted in a form of data flow diagrams (DFDs) that is the technique for organizing and documenting the structure and flow of data through a system's process. For these pictures defined our entire business processes, we begin with project scope of our system to look for the information about interface focus that documented in a context diagram. It is shown in Figure F.1. After identifying context diagram, the order processing information system can be divided into subsystem data flow diagrams in lower levels that shows data flow details to specify deeper information of each subsystem. It is shown in Figure F.3. to F.8. Then, these gathering of subsystems will represent the whole processes system (level 0) that is shown in Figure F.2. Finally, this data flow diagrams (Logical DFDs) which is introduced for our business requirements can be used to develop a technical design (Physical DFDs) to implement the propose system.

(2) Database Design

According to our business requirements used to create useful information, it is classified into a related data that has been analyzed to be ready for implementation as simple, nonredundant. flexible, and adaptable database. The Entity Relationship Diagrams (ERDs) is a tool to create the database model representing the whole picture of our system's data. These

related data will be kept in a database. In particular, the data are described in terms of the entities and relationships that meet with system users and system owners to support our propose system. For data architecture, we will use the distributed relational database to apply in the system. The entity relationship model and tables of structure chart diagram (key data, data type, data domain, attribute, and etc.) are shown in Appendix C.

(3) Input and Output Design

The business transactions and inquiries are often best processed when they occur. Errors are identified and corrected more quickly. It permits greater human interaction in decision making. Inquiries and report can be processed immediately. It could reduce the response time. The input transaction and information requests are transmitted online to several computers for processing. In addition, for middleware, we will use ODBC (Open Database Connectivity Standard) that is attached to the Visual InterDev program to interconnect with another database with another platform.

(4) User Interface

For interface architecture, the web graphical user interface (GUI) will be designed to reach the interactive on-line interface between system user and the computer device. This interface provided a friendly ease of use by application to process inputs and obtain outputs. It has only start web browser and input the html address of the program and login to the systemUser interface for this system involves many screens as existing in any kind of computer plus related screens for accomplishment designed system solution. The user interface design is shown in Appendix A.

(5) Software Design

The software design is the last step to complete a system design of the proposed system. After we have designed the database, input, output, and user interface, we have to select the appropriate packaged software and computer equipment that should be installed during the system design. So, the computer programmer has to present programming specifications for implementation the system.

The structured design is used to deal with the size and complexity of selected program. This technique will assist our computer programmers to design the program as a top-down hierarchy of modules that presents the result in a computer program, which is easier to implement and maintain.

Typically, structured design requires data flow diagrams to construct the structure chart, tool of this technique, to graphically depict a modular design of program. The pictures are illustrated in Figure G.1. to Figure G.6.

3.3 Hardware and Software Requirement

For the new system, the selection of hardware and software specification is the major important point to support system design and implement the proposed system. In addition, the cost of computer hardware and software are not too expensive compared with the past and the performance is likely the same or increasing. So, the high quality hardware and software performance with the appropriate price is the best way to reduce cost of implementing to get most benefits for our business.

The new system requires only one server to provide services needed by any client. It must have to use the high specification in server because everything is run and processed on server. The database must have more efficiency to support business and customer data. It also has a good database management system (DBMS) to manage data extracted or retrieved from different information. The following Tables 3.1 and 3.2. show details of selection hardware and software.

Hardware	Specification							
CPU	Dual 1 GHz, Pentium III, or higher							
Cache	512 MB or higher							
Memory	256 MB 100 MHz, ECC, SDRAM							
Hard Disk	40 GB or higher							
CD-ROM Drive	52X or higher

3.4 Security and Controls

Nowadays, information becomes an invaluable asset, the various methods are created to protect from all possible harms. Since the computerized system of Order Processing Information System is designed in a form of distributed data, the concern is toward the authority for accessing the data. The user authentication is established and implemented. This is just the first phrase of protecting the value of data to remain secret, possess integrity and availability for all users.

The security of a computerized system possess the properties as follows:

(1) User Identification

At the beginning, each user receives the password to access the data at the level that their job is related to. They are not able to access the data out of range of their authority. The system will detect the unauthorized user if that user is not allowed to access that particular information area. The first step is to set the input interface that the user has to enter their password for getting into the system. This is a method to prevent and ensure only authorized users can enter the system. The password of each user is encrypt and kept in the Right database. This encrypted method will encrypt the password into a meaningless form so other users are unable to read and understand.

(2) Program Security

This problem cannot happen because we build the web page by using Visual InetDev Program. When we begin to build the web page, the program will ask us to tick Secure Socket Layer (SSL) Function or not. If we tick it, the page will be coded to be the SSL page format. When we enter

the data through the web, the data is automatically encrypted and other person can not capture and see our data.

(3) Physical Security

Network administrators have increasing concerns about the security of their networks when they expose their organizations' private data and networking infrastructure to Internet crackers. To provide the required level of protection, an organization needs a security policy to prevent unauthorized users from accessing resources on the private network and to protect against the unauthorized export of private information. Even if an organization is not connected to the Internet, it may still want to establish an internal security policy to manage user access to portions of the network and protect sensitive or secret information.

It is best to describe first what a firewall is not: a firewall is not simply a router, host system, or collection of systems that provides security to a network. Firewall is an approach to security. It helps implement a larger security policy that defines the services and access to be permitted. The main purpose of firewall system is to control access to or from a protected network. An Internet Firewall is a system or group of systems that enforces a security policy between an organization's network and the Internet. Firewall permits only authorized traffic to pass, and the firewall itself must be immune to penetration.

(4) Data Entry and Validation

The GUI control and technique can reduce the rate of errors made by user. The program can be set to check every line that is entered. This can ensure the quality of the data produced.

(5) Database Control

With the authority of each user to be able to read, write, delete and modification to the database, this specific range can protect from out of range access through the data from any damage to the database system.

3.5 Cost and Benefit Analysis

(1) Cost Analysis

Cost Analysis is the technique for testing the economic feasibility. The economic feasibility refers to the cost-effectiveness of a project. Cost and Benefit Analysis determines whether the project is cost-effective.

Investment Cost: this is a onetime cost that will not recur after the project has been completed. This will include the cost of hardware, software, personnel and other expense.

The Investment Cost, is classified into two parts, which are:

- (a) Development Costs are onetime costs associate with the analysis, design and implementation of the system.
- (b) Implementation Cost: the costs are related to the implementation of the system. This will include the costs such as training cost.

Apart from the Investment Cost, Annual Operating Cost may be a fixed costs over time or variable with respect to the system usage.

The Existing and Computerized System Operational Cost is listed on Table 3.7 and Table 3.8.

Cost items	Years

Table 3.8. Computerized System Cost Analysis, Baht.

.

,
(2) Benefit Analysis

The benefits from the computerized system can be generalized into two categories.

Tangible benefits

- (a) Improve connection of transaction processing that could reduce time and expense.
- (b) Past record reference.
- (c) Reduce documentation work.
- (d) Support management requirement to analyze report in timely basis.
- (e) Decrease employee and paper.

Intangible Benefits

- (a) The accuracy of the computerized system makes mistakes less than the manual system.
- (b) High reliability of computerized system makes less mistakes than the manual system.
- (c) Increase the speed of transmitting information to business partners.
- (d) Improve business activities without the steps of complexity and also it supports the growth of the company in the near future.
- (e) High level of security.
- (f) Explosive demand by facilitating the business partners.

In Table 3.9 shows the Five Years of Existing Cost and Accumulation

In Table 3.10 shows the Five Years of Computerized Cost and the Accumulation.

In Table 3.11 shows the Comparison between Accumulation of Manual Cost and Accumulation of Computerized Cost.

In Figure 3.2 depicts the Break Even Analysis between the Existing System and the Computerized System. There are two kinds of line, which are shown in Figure 3.2. One line stands for the Existing System and another one stands for the Computerized System. With the Break Even Analysis, the range of five years has been used to compare the accumulated cost between the existing system and the proposed system.

Apparently, the cost of the investment in the first year of the computerized system is higher than the existing system. For the following years, the cost of the computerized system tends to decline while the cost of the manual system increases dramatically. At one point, where these two lines cut across each other is called the Break Even Point. As in the Figure 3.2, within 1 year and nearly 2 months the proposed system would have reached the Break Even Point, and thereafter, becomes more economical to operate than the existing system.

Year 🤺	Total Manual Cost	Accumulated Cost
1 2	1,150,000.00	1,150,000.00
2	1,243,000.00	2,393,000.00

(3) Payback Analysis

This is one of the popular methods for determining if and when an investment will pay off. As the company has to invest a certain amount of budget for the development cost long before the benefits are received, this will take a period of time for the benefits to overtake the costs.

Payback Period for the Proposed System can be calculated by the following formula:

Payback Period = C / (A + B) Where: . A = Last year of negative cash flow difference B = Cumulative difference last negative yearC = Absolute value of cumulative difference

(4) Net Present Value

The Net Present Value determines whether it is worth an investment for a computerized system, if the substraction of the net present value of lifetime cost with the sum of the net present value of lifetime benefit returns the positive value. This can indicate a reasonable or good investment for the company.

(5) Return on Investment

This technique is used to compare the lifetime profitability. The return on investment for a project is a percentage rate that measures the relationship between the amount the business get back from an investment and the amount invested.

The return on investment is calculated as follows:

ROI = (Estimated Lifetime Benefits – Estimated Lifetime Cost) Estimated Lifetime Costs

IV. PROJECT IMPLEMENTATION

4.1 Overview of Project Implementation

In the past, we concentrate on using Visual InterDev as a tool in developing and designing the program for the Order Processing Information System. We try to implement the program to be user-friendly as well as easy to read and understand programming logic and user can use this program through the web browser. We start the designing of the program from the point where the user can search for the desired customer profile. User can create, update and delete the data of unwanted customers through the web. Users don't install any program. They just open the browser and type the address of the program in server. The programming logic can be applied to the supplier profile as well. The program also can record customer purchase order and retrieve the data when it is necessary. The user also is able to issue company purchase order, company invoice as well as company delivery order. The report also can be created based on the user and management requirement.

4.2 Hardware and Software Installation

Our new system requires to purchase at lease software packages toward installing the new software system. The system software specific is system server that includes Microsoft Windows 2000 server for operating system and Microsoft Internet Information 5.0 Web Server. Additionally, the Microsoft SQL Server 7.0 is installed in the server to be software to create a system database. For the operation, both server and client sides are a McAfee Virus scan to protect the vulnerable system.

4.3 Test Plan

After the program has been designed and implemented, it now comes the testing part. Testing process is conducted to detect and correct the errors. It also tests the unification of each module in the entire system. All possible ways to get off the route, apart from the program, are designed and problems must be found and prevented from happening in the future. We have to test whether the program is easy to use and understand if we are the users. If it was hard to follow and understand, then we have to make it more simple. We have to test from the general level to a level that is more specific in order to ensure the correctness of the program. The next implementation thing in testing process is the peak load testing. It can determine whether the system is capable of handling the high volume of activities that occur when the system is at the peak of the processing.

4.4 Conversion

Parallel conversion is the company's choice for the conversion plan. System conversion consists of Data Conversion and System Installation. The major objective is to install the computerized system to replace the manual system. All the data previously kept on paper is now recorded in the designed database. This process must be executed carefully since the conversion of data takes a certain time to process while the existing system is running in a parallel processing until the full computerized system is ready.

4.5 Training

After the program has been tested and installed, there comes the process of training for the user to be familiar and able to use the program correctly. As we know, some user may not know how to user the computer at all. This is the process to teach the user to understand the flow of the program and probably the logic. System analysis, programmers and vendors are assigned to train the users. The methods used are demonstration of the equipment, create the training manual, give lectures about the procedure, discussion, question and answer and hands on experience with new equipment.

V. CONCLUSIONS AND RECOMMENDATIONS

5.1 Conclusions

This new computer system is developed to analyze, design and implement the "Order Processing Information System" for Sales department of Chaiwat Electric Company to facilitate the routine tasks of employees, eliminate the complexity of passing documents, provide better service to customers and improve the handled transaction. In the existing system, most activities have been done manually which made the company face many problems in handling the transaction like excessive paper, cost of communication, trace of previous record, information for their customers.

The new system is designed to meet the requirement of users and management. It could provide better service to the customers and help staff to do their routine tasks quickly and effectively. In addition, the new computer system made the company need fewer employees to handle the transaction than before.

The proposed system has several parties involved in order to make the system successful. First, System owner should see the importance of the computer information system and allocate the budget for this system and give the useful information. Second, the system users who give the useful information since they are the ones who actually use this system.

Table 5.1 shows the time spent on each process of the Existing System compared to the Proposed System. It shows that each process of the Proposed System uses less amount of time to finish the mission. This can explain that the Proposed System is far more efficient and effective than the Existing System.

Process	Existing System	Proposed System
Create Customer Record	20 mins.	1 min.
Search for Customer Profile	30 mins.	1 min.
Record Customer P/O	25 mins.	1 min.
Produce Company Invoice	20 mins.	2 mins.
Search Supplier Profile	30 mins.	1 min.
Record Company P/O	15 mins.	2 mins.
Total	2 hrs. 20 mins.	8 mins.

Table 5.1. The Degree of Achievement of the Proposed System.

The process of creating customer or supplier profile can be done by just clicking on the 'New' button. The new window will pop up, then the user need to enter the required data to the provided text box. After finishing with the details then click on the 'Update' button. This time the new profile has been created successfully while taking less amount of time.

For the process of searching customer profile, the user is required to press record navigation bar button and then browse through until the user finds the right customer. Other method is provided as well, the user has to key in the customer number then the closet range of customer number the name will appear then the user needs only to select the desired customer. This concept is also applied in searching supplier profile as well.

Now, we are at the phase of recording customer or company purchase order. The user needs only to enter the data to the provided space then click the 'Update' button. The information is now recorded to the following files for future reference.

For the part of generating company invoice, the user does not have to enter the invoice number. This invoice number is already pre-specified within the program, the last number of the invoice will come up automatically. The user does not have to search

for the last time previous number at all. This provides a helpful in arranging the invoice number with the correct sequence and easy for searching in the future.

5.2 Recommendations

In every step of system development, employees and other users should be involved and have participated since they could gradually be familiar to the new system. The proposed system is designed to meet users and management needs. The system tends to use the program that is easy for the users to use and operate. This system is designed to be the client/server system that can be used to interact within and outside the company. We have to test the proposed system and get feedback from the users before it is launched for the real use.

However, If we want to become successful in implementing the Order Processing Information System, the following factors should be considered:

- It should have a supporter for the computer program in the company in case of program malfunction.
- (2) Frequently reviews and keeping up to date of the user requirement to correct the mistakes and development in the future.
- (3) The company may adapt the computerized system to other departments such as Accounting and Logistic Department. This will enhance the processing performance, reduce work cycle and eliminate unnecessary paper work.
- (4) The new Order Processing Information System needs to have Network administrator to handle and support the technical requirements about the network of the company.
- (5) In the future, the company should implement the Quality of Service (Qos) to manage the traffic and task and allocate bandwidth for ordering program.

<u> </u>					

Table D.8. Customer Table.

No.	Data Element	Meaning
1	CUST_CODE	Customer Code
2	CUST_DESC 🦾 🥌	Customer full name
3	CUST_MEI_CODE	Global code for the customer
4	CUST_CONTACT	Contact name
5	CUST_OFF_ADD1	Customer's office address
6	CUST_DEL_ADD1	Customer's delivery address
7	CUST_TEL1	Tel. no. of the customer
8	CUST_FAX1	Fax no. of the customer
9	CUST_TEX1	Telex no. of the customer
10	CUST_BUSS_FLD	Business field code of the customer
11	CUST_COMP_GRP	Company group of the customer
12	CUST_DFLT_CURR	Default currency of the customer
13	CUST_CRDT_LIMIT	Credit limit of the customer
14	Credit Balance	Balance of credit
15	CUST_PAY_TERM	Payment term of the customer

## St. Gabriel Library, Au

No.	Data Element	Meaning
16	CUST_COUN_CODE	Country of the customer
17	CUST_BANK_NAME	Trade bank code for the customer
18	CUST_ACC_NO	Account number of customer
19	CUST_ACC_CODE	Account code of customer
20	CUST_RANK	Ranking of customer
21	CUST_STOP	Stop
22	CUST_RESALE	Customer Resale

Table D.8.	Customer	Table (	(Continued)	).
------------	----------	---------	-------------	----

Table D.9. Customer Thai Table.

No.	Data Element	Meaning
1	CUST_D_DESC	Customer full name in Thai
2	CUST_D_OFF_ADD1	Customer's office address in Thai
3	CUST_D_OFF_ADD2	Customer's office address in Thai

Table D.10. Currency Table.

No.	Data Element	ทยาลัยอัลลิชิ Meaning
1	CURR_CODE	Currency code
2	CURR_DESC	Currency description
3	CURR_YR	Year for the exchange rate.
4	CURR_MTH	Month for the exchange rate.
5	CURR_RATE	Exchange rate for the period.

### Table D.11. Department Table (Continued).

No.	Data Element	Meaning
1	DEPT_CODE	Department code
2	DEPT_DESC	Department name

### Table D.12. Section Table.

No.	Data Element	Meaning
1	SECT_CODE	Section code in the Department
2	SECT_DESC	Section name -
3	SECT_SDIV_CODE	Division Code in MEI
4	SECT_ACC_CODE	Section A/C code

Table D.13. Delivery Table.

No.	Data Element	Meaning
1	Delivery Code	Delivery Code
2	DELV_NAME_D	Delivery full name in Thai
3	DELV_NAME_E	Delivery full name in English
4	DELV_ADD_D1	Delivery address in Thai
5	DELV_ADD_E1	Delivery address in English
6	DELV_TEL	Delivery Telephone
7	DELV_FAX	Delivery Fax

Table D.14. Model Table.

No.	Data Element	Meaning
1	MODL_MODEL_NO	Model No.
2	MODL_MODEL_DESC	Model Description
3	MODL_CATA_CODE	Cataegory code

No.	Data Element	Meaning
4	MODL_STOP	Stop
5	MODL_ISO	Model ISO
6	MODL_UNIT_CODE	Unit Code
7	MODL_MIN_ORDER	Minimum order quantity
8	MODL_MIN_LEVEL	Minimum level
9	MODL_COMM_CODE	Commodity code
10	MODL_WEIGHT_COST	Weight Cost
11	MODL_LATEST_COST	Latest Cost
12	MODC_CUST_CODE	Customer with own model no.
13	MODC_CUST_MODEL	Customer model no.
14	MODC_CUST_MODEL_	Customer model description
	DESC	

Table D.14. Model Table (Continued).

Table D.15. Payee Table.

No.	Data Element	Meaning
1	PYEH_CODE	Payee Code
2	PYEH_NAME	Payee Name
3	PYEH_PAY_DATE	Payee's due date
4	PYEH_ACC_CODE	Payee's code for account system
5	PYEH_PAY_TRM	Payment term for the payee
6	PYEH_MEI_CODE	Global code for the payee
7	PYEH_SUPP	Suppliers for the payee

No.	Data Element	Meaning
1	MPH_MODEL_NO	Model No.
2	Model Description	Model No. Description
3	MPH_CUST_CODE	Customer code for the price
4	MPH_SUPP_CODE	Supplier code for the cost/Price
5	MPH_PRIC_TRM	Price term
6	MPI_EFF_DATE	From this day price is effective
7	MPI_EXP_DATE	Unit this day price is valid.
8	MPI_COST_CURR	Currency code for direct cost
9	MPI_COST	Direct cost
10	MPI_DCOMM	Direct cost commission
11	MPI_PRIC_CURR1	Currency code for Price 1
12	MPI_PRICE1	Price 1
13	MPI_PRIC_CURR2	Currency code for Price 2
14	MPI_PRICE2	Price 2
15	MPI_PRIC_CURR3	Currency code for Price 3
16	MPI_PRICE3	Price 3
17	MPI_IPRIC_CURR	Currency code for indent price
18	MPI_IPRICE	Indent price
19	MPI_COMM	Commission for
20	Markup percentage1	Markup percentage for Price 1
21	Markup percentage2	Markup percentage for Price 2
22	Markup percentage3	Markup percentage for Price 3

 Table D.16.
