## Master Project Approval

Project Title                      Computerized System for Agriculture Co-operation

By                                      Ms. Sawika Opat  
Project Advisor                      Asst. Prof. Dr. Thotsapon Sortrakul

Academic Year                      2/2003

---

The Department of Information Technology , Faculty of Science and Technology of Assumption University has approved this final report of the **three** credits course. **IT6900 Master Project**, submitted in partial fulfillment of the requirements for the degree of Master of Science in Information Technology .

Approval Committee:

  
(Asst. Prof. Dr. Thotsapon Sortrakul)  
Advisor

  
(Dr. Kittipong Srisansanee)  
Committee Member

  
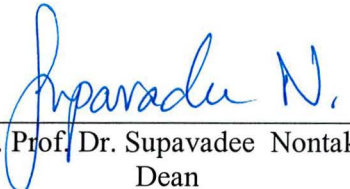

(Dr. Boonlert Watjatrakul)  
Committee Member

  
(Asst. Prof. Dr. Thiraphong Charoenkhunwiwat)  
Committee Member

---

Faculty Approval:

  
(Asst. Prof. Dr. Thotsapon Sortrakul)  
Program Director

  
(Asst. Prof. Dr. Supavadee Nontakao)  
Dean

February / 2004

## **ACKNOWLEDGEMENTS**

I would like to express my appreciation and thanks to Asst. Prof. Dr. Thotsapon Sortrakul for his encouragement and advice through the course of this project's development. I would like to thank Dr. Thatchai Chuenchom and Dr. Jirapun Dangdej for their attentive teaching on System Analysis and Design and Software Engineering course.

My thanks also go to the staff of the Faculty of Science and Technology for all the assistance throughout my curriculum. And I would like to thank all my friends who helped me correct the problems in development of the project.

Finally, many thanks for employees of Thaklong Agriculture Co-operation for their kind collaboration and assistance in providing useful information for developing the new computerized system.

## **ABSTRACT**

Thaklong Agriculture Co-operation is a medium size cooperation which has more than 1,000 members with 20 million baht of annual net-profit, but each department still performs all functions manually (paper-based). Information seeking and analyzing by human operators cause some errors and redundancy. Computerized system for the co-operation is developed for resolving this problem. This system will perform all the processes, and the functions of five departments namely administrative, loaning, finance, marketing and accounting. It is used to support business activities by taking advantage of computer technology. I believe that the new system will increase speed and accuracy of business processes and customer satisfaction. This system will replace the old manual system. To achieve these goals, it requires a sophisticated computer information system as well as database management system.

This new computer-based agriculture information system is designed to be menu-driven and highly user-friendly. The advantage of this system is it allows each department to perform jobs more efficiently and effectively by sharing information on the same database. The methodology and design of computerized system is presented in this paper. An analysis of the old system needs identifying several problems, which aids us in creating new system to meet user requirement. It is much better to create a prototype for testing system before a real implementation. Also, it is able to guarantee users satisfaction. The computer security, the indispensable part of system, is also considered in this paper.

# **CHAPTER 1**

## **INTRODUCTION**

### **1.1 Background of the Project**

Nowadays, running business requires a good way to manage the resources in organizations for efficiency and effectiveness of proceeding. Information technology (IT) has become a major facilitator of business activities in the world today. Therefore, IT is used extensively for productivity improvement of business processes.

“A computer-based information system is an information system that uses computer technology to perform some or all its intended tasks.” [1] Use of the information system is usually central to operating the business processes successfully. Information technology enables people to design and implement improvement, including new processes and facilities of increasing complexity and novelty. This project is concentrated on the work or process of agriculture co-operation system. We adapt from paper-based system to computerized system.

The computerized system for agriculture co-operation will help increase productivity of operation and save the resources of organization such as time of operation, paper and etc. Moreover, this system will increase satisfaction of customers because the time in operation is faster than the old system. And, it helps to manage the organization and plan the mission.

### **1.2 Problem Definitions**

At present, Thaklong agriculture co-operation that I use as a model is a medium sized co-operation. There are 1,000 members and the company has net-profit around 20 million baht per year. In accounting department, accountants are responsible to organize daily and annual account report. For finance department, the officers have responsibility about deposit-withdrawal money service, calculating

interest, and undertaking all works concerned. For loan department, its duty is lending out money. For marketing department, the employees are responsible for providing and selling product and organizing inventory report. For administrative department, they prepare monthly report for manager and board of co-op which is used in monthly meeting. And, they have functions about document record, employee profile and recruitment.

All the above functions are dealt manually and based on paper transaction. Although they have PCs, they just use them only for word processing and excel program which is not a worthwhile purpose. Each work takes more time in processing and often error or mistake occurs in business functions such as generating report, calculating some value in any process, recording information, etc. Accordingly, the manager and the board deem it fit to create a new computerized system for developing efficiency and effectiveness of the organization. So, the proposed system will be based on computer and Database Management System (DBMS) which enables managing and operating for maximum performance with consuming less time in many areas of work, including annual account report preparing, all jobs concerning customer services, managing budget and planning for the goal of the organization.

### **1.3 Objectives of the Project**

The objectives of the computerized system for agriculture co-operation are as follows:

- 1) To analyze the process of works of each department in order to identify the cause of problems.
- 2) To develop and implement the new computerized system to replace the existing system to enhance efficiency of business process.

- 3) To use the new system for reducing time consumption in business activities.
- 4) To increase the quality of customer service by using the proposed system.
- 5) To reduce the error in business activities and reduce the operation cost such as paper cost, human error cost and overtime payments to the employees.

#### **1.4 Scope of the Project**

The project is focused on the system adaptation to the computerized system from the old system for supporting the agriculture co-operation operations, so I separate the main functions to be main menus of the new system. Therefore, the scope of this project covers main functions that include the following:

- 1) The system will be run on two PCs which are connected in the form of peer-to-peer structure to facilitate information sharing.
- 2) The system provides functions for each department, namely loaning, accounting, marketing, finance and administrative work.
- 3) The system provides searching function by using keyword such as customer's name, customer's ID, account book no, loaning no or other keys in each activities.
- 4) The system provides performance report for the head of each department and manager.
- 5) All information will be stored in the database for supporting all the above jobs.

## CHAPTER 2

### EXISTING SYSTEM

#### 2.1 Background of the Organization

Thaklong agriculture co-operation has been established since March 1, 1985 for service members almost all of whom are farmers. Its main business concerns about loaning and deposit services and selling low-priced products for members.

Figure 2-1 Organization Chart

According to the organization chart, there are five departments which include account, finance, loaning, marketing, and administrative. The responsibilities of each department are defined as follow:

##### 1. Accounting Department

- Responsible for generating account receivable and account payable.
- Responsible for organizing daily, monthly account and annual report.

##### 2. Finance Department

- Responsible for deposit services.
- Responsible for recording stock of members.
- Responsible for paying employee salary.
- Responsible for member application.

- Responsible for generating report about deposit, stock and the number of members.

### 3. Loan Department

- Responsible for servicing loans for members.
- Responsible for generating report for controlling loan.

### 4. Marketing Department

- Responsible for providing products for selling.
- Responsible for organizing the product inventory.
- Responsible for allocating dividend of members.
- Responsible for generating report about purchased product, product inventory and dividend money.

### 5. Administrative Department

- Responsible for generating document for board meeting.
- Responsible for organizing document record.
- Responsible for recording employee profile.
- Responsible for recruitment of appropriate personnel.
- Responsible for all administrative tasks.

## 2.2 Overview of Existing Co-operation's Operating Functions

The existing system is described according to the details of operating functions of each department as follows:

In Accounting Department, accountants will collect all operating documents from other departments such as invoice, receipt, deposit and withdrawal paper, loaning receipt, etc. Then, they will summarize the account receivable and payable after service time ending (3:00 p.m.). Next, they will organize daily account report.

And, they will generate monthly and annual report for submitting to the manager, committee and auditor of Office of Inspector of Cooperative Accounts. All of this is done manually.

In Finance Department, officers will respond to customers and control stock and money in process. When members want to deposit or withdraw, they will fill the deposit or withdrawal form and place to the officer together with their accounting book. Then, the officer will continue the process of deposit or withdrawal service by using typewriter. They also will respond to new member application. They will help fill the member form and attach the copy of their ID card and census record. Then, the officer will file this data and generate member identifying book. Next, they will deal with stock holding of members which is 10 baht per stock and members will have at least 50 stocks (500 baht). They will generate monthly report about the amount of deposits, stocks and members and submit to the manager and committee by using Microsoft Excel.

In Loaning Department, members, wanting to get a loan, must mortgage their property at Land Department Office of district before loaning process is started. Then, the officer will begin with consideration of the petition. When it is admitted, the member will be contracted with the co-operation. Then, they will get money and 5% of it will be deducted to become their stock. For example, if a member borrows 100,000 baht, they will get 95,000 baht and the rest will become to his/her stock. For the repayment of a debt, the officer will process manually by using calculator and writing the detail on the loan form. They will generate monthly report for controlling loan and submit to the manager and the committee by using Microsoft Excel.

In Marketing Department, officers will generate receipt when a member purchases products such as rice, paddy seeds, chemical fertilizers, and gasoline. And,

they will provide products for sales. They will contact the supplier and propose price to the manager for approval. Then, they will buy products. After that, they will record information in the product purchasing book. They will organize product inventory every day. At the year-end, they will allocate dividend by looking from total of products purchased by members. All of the process is done manually.

In Administrative Department, officers deal with all the works that are related to employees and the whole office. They will prepare and generate documents for board meeting by using Microsoft Word. They will organize the document number for both received-document and sent-document. Then, they continue to record the document number in file by hand writing. They are also responsible for employee profile recording.

### **2.3 Areas for Improvement**

As I described in the problem statement above, there are sequential problems namely inaccurate data, redundant tasks, inefficient report and unsatisfied customer.

So, I will determine the areas of improvement as follows:-

2.3.1 To provide data accuracy. The proposed system will provide calculating and managing information accuracy because the proposed system will be based on computerized program (Microsoft Access program) which has high capability in information management.

2.3.2 To reduce task redundancy. The proposed system is designed to reduce tasks in generating reports. It can generate report automatically by using information from system database instead of reentering.

2.3.3 To increase customer satisfaction. Therefore, the proposed system can reduce the time of processing customer services that can improve customer satisfaction.

The proposed system can respond to the organization's requirements and resolve the problems of the existing system. It helps reduce time consuming in operating. It is developed to adapt the existing system functions to become a computerized system for supporting the agriculture co-operation's operations.

## **CHAPTER 3**

### **PROPOSED SYSTEM**

#### **3.1 Project Methodology**

“The System Development Life Cycle (SDLC) is a model for developing a system by dealing with sequential steps and options for revisiting steps when problems appear.” [2] So, I use SDLC as a model to develop this proposed system of co-operation. There are 6 phases in this methodology:

- Project identification and selection

In this phase, I will identify needs of the company and the proposed system. Then, I will determine the priority of the need and plan to schedule the activities of system development.

- Project initiation and selection

I will explain why the system should be developed and define the problem of the old system. Then, I will determine the scope of the proposed system. Next, I will start to plan the step for developing the system by using the SDLC steps. And, I will determine the cost of developing and benefit of the project.

- Analysis

The first thing that I do on this phase is requirement determination after I interviewed with users about requirements that they need from the proposed system. Then, I will study the old system for comparing with user's want. Next, I will generate initial design to match the requirements within cost and technical levels.

- Design

I will design the new system in all aspects from input, output, database, and computer processes which must be suitable with hardware and software specification.

- Implementation

Coding is the first work of this step. After that, I will progress to test the system until it meets the acceptance of user in each department. Next, I will check security of personnel who can access the system. Then, I start to install the new system by using parallel installation. And, I will organize the documentation and training for users.

- Maintenance

When the system is being operated, users may find problems with work process and want a better ways to perform their functions. So, the programmer will modify the system for responding to the changing business conditions.

### **3.2 User Requirements**

In the process of collecting the requirements, I obtain it by interviewing group of users and using the existing system operation. This system is developed for responding their routine jobs. The requirements are concluded as follows:-

1. All information is provided with accuracy such as the details of members, deposit and loan process, product, selling and account.
2. To reduce human error in operation which can lead to waste of time and money. The users want the system that has accuracy in calculating and retrieving information.
3. To improve the speed in operation, this system will reduce the steps of business functions.

4. Input and output screen should be designed with user friendly interface.
5. The user should be able to easily generate any report on a daily, monthly or yearly basis.

### 3.3 System Requirements

1. The new system should have security control in operation by having login page that can verify the user name and password.
2. The system should be menu driven and the function should be user friendly so the users, having low computer skill, can also work with it.
3. The form and report should be generated in a standard way because the Department of Inspector of Cooperative Accounts will assign the documents in easy-to-audit format.

### 3.4 Hardware and Software Requirements

- Workstation (2 units)
  - 128MB DDR-RAM
  - 40GB HDD
  - CD Drive: 52X
  - Monitor 15"
  - Embedded VGA AGP 32MB (1 AGP slot available)
  - Built-in 3D sound
  - 10/100 Mbps built-in LAN
  - Mouse and Keyboard
- Dot Matrix Printer
- Printer sharing box
- UPS
- Operating System: Windows 2000 or latest version

- DBMS: Microsoft Access 2000
- Development Tool: Microsoft Access 2000

### 3.5 Cost and Benefit Analysis

“The purpose for accessing economic feasibility is to identify the financial benefits and costs associated with development of the project. Economic feasibility is often referred to as cost-benefit analysis. It helps in decisions on spending or investment by determining if it is the worthwhile to develop a project or not.” [2]

#### 3.5.1 Benefit Analysis

An information system can provide many benefits to an organization. The new system can automate routine jobs, reduce errors, provide innovative customer services, and improve organizational efficiency, speed, and flexibility.

The benefits of the system are classified as tangible and intangible:

1. Tangible benefits are benefits that can be measured in terms of profit to the company. The following benefits could be derived from the proposed system:-

- Reduce overtime cost

Because of using the new computerized system, it can increase the speed of business processes and it can reduce error of works such as deposit and withdraw service, loaning service, accounting and inventory. These works used to take more time in processing and sometimes errors occur in the existing system. On average, employees work overtime around 2 months per year because they have to prepare the information which begins from mid of January to end of March for generating their annual reports so they must work overtime to finish their works by the fiscal year-end (end of March).

Therefore, the organization must pay overtime cost approximately 140,000 bath which equals to 2 month salary of all employees. When the organization begins to use the new system, it can save this overtime cost.

- Reduce cost of papers

The organization pay cost of papers around 100,000 bath per year. Normally, the existing system stores all information on papers or books so when we change to use the new computerized system every report can be updated and generated on database without printing everything. Calculating data and collecting information are done on the notepad so the new system can reduce 30 percent of paper cost. Therefore, using the new system can save 30,000 bath in paper cost.

**Table 3-1 Tangible benefits worksheet**

<b>TANGIBLE BENEFITS WORKSHEET</b>	
<b>COMPUTERIZED SYSTEM FOR AGRICULTURE CO-OPERATION</b>	
	Year 1 through 5
A. Reduce overtime cost	140,000
B. Reduce cost of papers	<u>30,000</u>
<b>TOTAL tangible benefits</b>	<b><u>170,000</u></b>

2. Intangible benefits are benefits which are believed to be difficult or impossible to quantify such as improving efficiency and effectiveness of business functions, increasing user satisfaction, supporting to generate report for manager for decision making, and improving user's computer skill.

### 3.5.2 Cost Analysis

The major cost analysis can be classified into 2 types:

- “One-Time Costs refer to those associated with project initiation and development and the start-up of the system such as system development, new hardware and software purchase, users training, site preparation and data or system conversion.” [2]
- “Recurring Costs refer to those costs resulting from the ongoing evolution and use of the system such as application software maintenance, incremental data storage expense, and incremental communications.” [2]
- The estimated costs and benefits over the period are discounted to present day values using a range of discount rates (5 percent rates). Now, Thaklong Agriculture Co-operation uses a discount rate of 10 percent for interest because the co-operation has to borrow money from bank at 5% interest. So they had to add another 5% for their profits.

Project Feasibility Study  
Economic Feasibility Analysis

BENEFITS	
Reduce overtime cost	140,000.00
Reduce cost of papers	30,000.00
TOTAL BENEFITS	<u>170,000.00</u>
ONE TIME COSTS	
1. HARDWARE	
3 PC & Accessories	84,000.00
2 UPS	7,500.00
1 Printer sharing box	8,000.00
1 Dot-Matrix Printer	11,500.00
Total Cost of Hardware	<u>111,000.00</u>
2. SOFTWARE	
Microsoft Window 2000 workstation	15,000.00
Microsoft Office 2000	28,000.00
Total Cost of Software	<u>43,000.00</u>
3. DEVELOPMENT & CONSULTANT	
System Analysis and Requirement Determination	15,000.00
System Design	25,000.00
Implement	15,000.00
Total Cost of Development & Consultant	<u>55,000.00</u>
4. INSTALLATION & TRAINING	
Installation	10,000.00
Training & Document	15,000.00
Total Cost of Installation & Training	<u>25,000.00</u>
TOTAL ONE TIME COSTS	<u>234,000.00</u>
RECURRING COSTS	
Application Software Maintenance	18,500.00
Hardware Maintenance	7,500.00
Supplies	20,000.00
TOTAL RECURRING COSTS	<u>46,000.00</u>

**Figure 3.1** Benefits and Costs of the Project

**Economic Feasibility Analysis**  
**Computerized System for Agriculture Co-operation**

	Year of Project						
	Year 0	Year 1	Year 2	Year 3	Year 4	Year 5	TOTALS
Net Economic Benefit	0	170,000	170,000	170,000	170,000	170,000	
Discount(10%)	1.0000	0.9091	0.8264	0.7513	0.6830	0.6209	
PV of Benefit	0	154,545	140,496	127,724	116,112	105,557	
<b>NPV of all BENEFITS</b>	0	154,545	295,041	422,765	538,877	644,434	644,434
<b>One-Time Costs</b>	(285,000)						
Recurring Costs	0	(46,000)	(46,000)	(46,000)	(46,000)	(46,000)	
Discount(10%)	1.0000	0.9091	0.8264	0.7513	0.6830	0.6209	
PV of Recurring Costs	0	(41,818)	(38,017)	(34,560)	(31,419)	(28,562)	
<b>NPV OF ALL COSTS</b>	(285,000)	(326,818)	(364,835)	(399,395)	(430,814)	(459,376)	(459,376)
<b>Overall NPV</b>							<u><u>185,058</u></u>
<b>Overall ROI - (Overall NPV / NPV of all COSTS)</b>							<u><u>0.40</u></u>
<b>Break-even Analysis</b>							
Yearly NPV Cash Flow	(285,000)	112,727	102,479	93,163	84,694	76,994	
Overall NPV Cash Flow	(285,000)	(172,273)	(69,793)	23,370	108,063	185,058	

Project break-even occurs between year 2 and year 3

Use first year of positive cash flow to calculate break-even function -  $((93,163 - 23,370) / 93,163) = 0.75$

Actual break-even occurred at 2.75 years

**Figure 3.2** Summary Spreadsheet reflecting the present value calculations of

all benefits and costs for the proposed system

### 3.5.3 Break-even Analysis

The Break Even Analysis shows at what point benefits equal cost. According to figure 3.2, the break-even point is occurred between year 2 and 3.

$$\text{Break-Even Ratio} = \frac{\text{Yearly NPV Cash Flow} - \text{Overall NPV Cash Flow}}{\text{Yearly NPV Cash Flow}}$$

Project break-even occurs between years 2 and 3

$$\text{Break-Even Ratio} = \frac{93,163 - 23,370}{93,163} = 0.75$$

Actual break-even occurred at 2.75 years

Figure 3.3 Break even point

### 3.6 System Design

#### 3.6.1 Database Design

The proposed system is created as a relational database. It uses Microsoft Access 2002 as a tool for database management.

#### 3.6.2 Data Flow Diagram of the proposed system

A Data Flow Diagram is a tool of process modeling, which helps to view overall data flow in the system. I will show the Data Flow Diagram of the proposed system as follows:

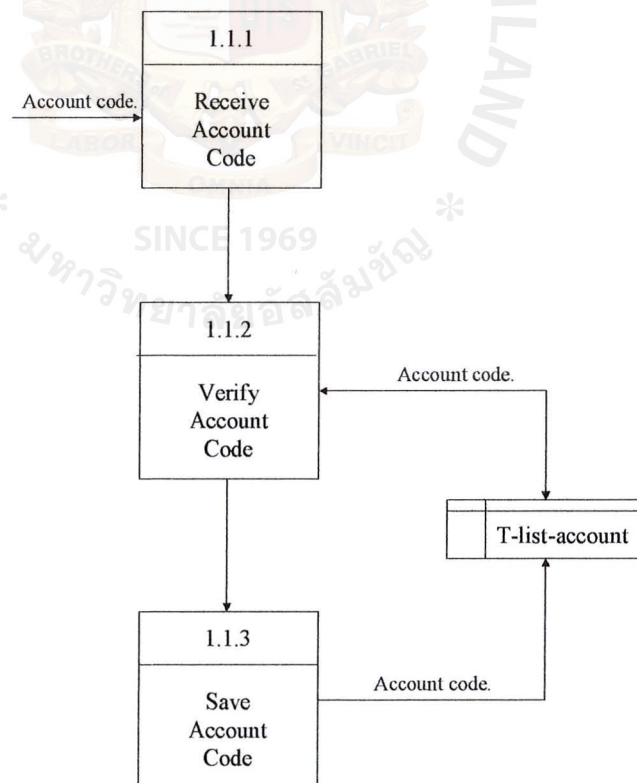

**Figure 3.4** Context Diagram of the proposed system

**Figure 3.5** Data Flow Diagram of the proposed system at Level - 0

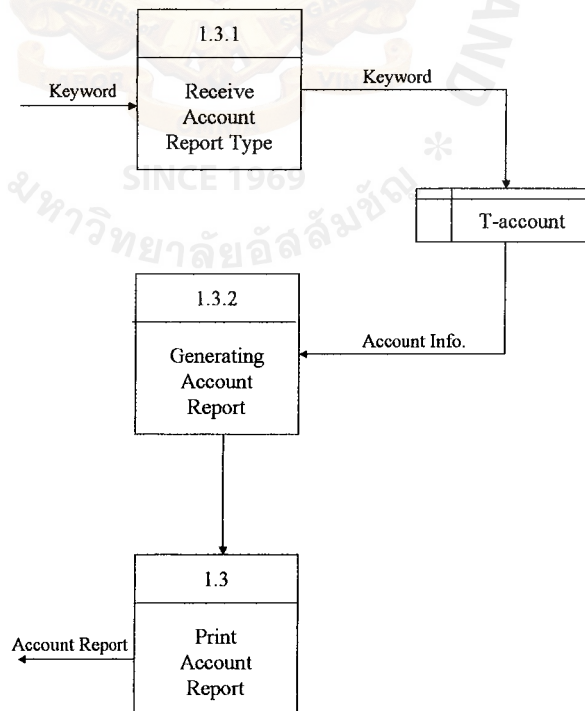

**Figure 3.6** Data Flow Diagram of the proposed system at Level – 1 Process 1

**Figure 3.7** Data Flow Diagram of the proposed system at Level – 2 Process 1

**Figure 3.31** Data Flow Diagram of the proposed system at Level – 2 Process 5

### **Process 1**

There are 3 main functions in Accounting Department. First, assigning accounting code to the accountant to enter a new account. The system has to check it from the list of account database. If it is not already assigned, it will be saved. Generating account receivable & payable is the second function. It starts at account information receiving then save it into account database. After that, we will print the daily account report. At last, we will enter key for selecting type of report that we want to print. Then, we will use that key in selecting data for generating report. After that, the report is printed.

### **Process 2**

This process include Finance Department's functions such as account-book opening, deposit/withdrawal processing, assigning interest on deposit, new member registration, stock operating and report generating. All functions will start with entering the concerned information. Then, the information will be saved into database. When we want to print any report, we just enter keyword for selecting the type of report. Then, the report will be generated by retrieving information from database.

### **Process 3**

When loan process begins, the officer will enter loan information such as mortgage and loan detail. Then, all information will be saved into database. And, 5% of the amount of loan is deducted to become the stock of this customer. After that the receipt is generated and printed. To repay a debt, the officer will enter loan ID. And, it is used as the key to retrieve information from database. Then, the system will calculate the amount of money that the member must pay. Next, the amount that the member has to repay is entered and saved into database. Then, the system will generate the receipt. For generating report, we will enter key for selecting type of

report that we want to print. Then, we will use that key in selecting data from database for generating report. After that, the report is printed.

#### **Process 4**

After we purchase products for sales, we will record the details into product and inventory files. In selling products, the officer will receive order from customers and they will enter it into the system. After that, the system will generate the receipt for customer and save order information into database. The order information is used to calculate dividend for members at the end of the year. For report generating, we will enter a key for selecting type of report that we want to print. Then, we will use that key in selecting data for generating report. After that, the report is printed.

#### **Process 5**

Document recording is used for keeping memorandum of the document details that are sent or received and the number of document. If the officer wants to file the employee profile, he can enter employee data into the system. Then, the system will progress to save this information into database. About vacation, the officer will enter vacation information. Before this information is recorded, the system will check the historical vacations. The administrators are assigned with the login name and password for system authorization. They enter the login information and the system will check it for protecting repeated information. When it is already proved, it is saved into database.

### 3.7 Proposed Schedule

Project Activities	November				December				January				February

## CHAPTER 4

### INPUT AND OUTPUT INTERFACE DESIGN

#### 4.1 Input Design

User interface design is the specification of a conversation between the users and the computer system. For this system, the input screen is designed by using graphical user interface (GUI) which is mostly used in the system development today. GUI environment can provide user friendly interface and various form of designed screens. The GUI controls such as text box, combo box, command button, etc. provide more flexibility in operation designing and data attribute showing.

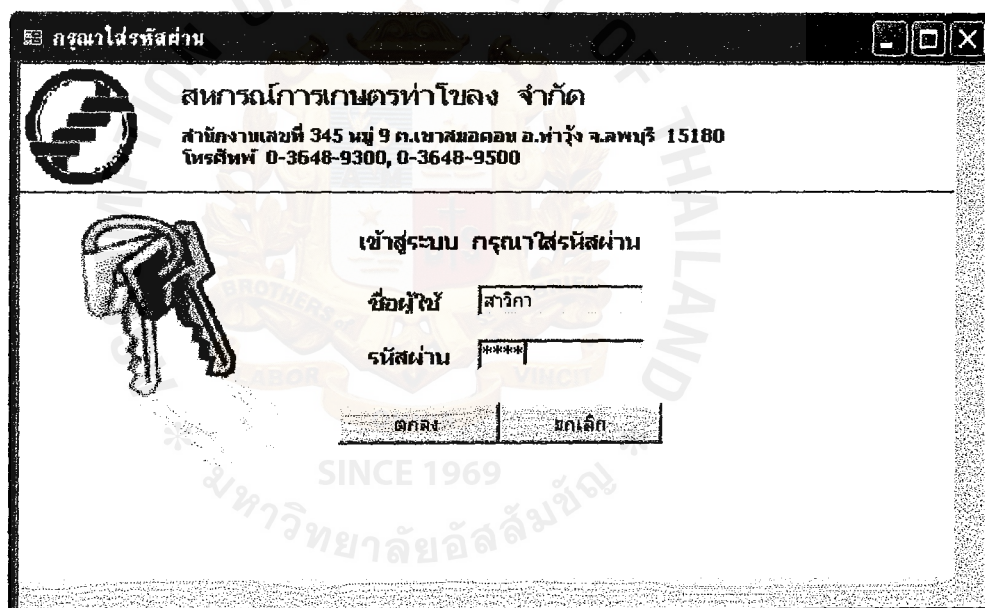

Figure 4-1 Log-in Screen

The first screen starts from the Log-in page in order to verify the authorized users. Users will be assigned with their own user name and password. If the user name and password is not correct, the system will notify the user. After verifying, the next screen will be the main menu.

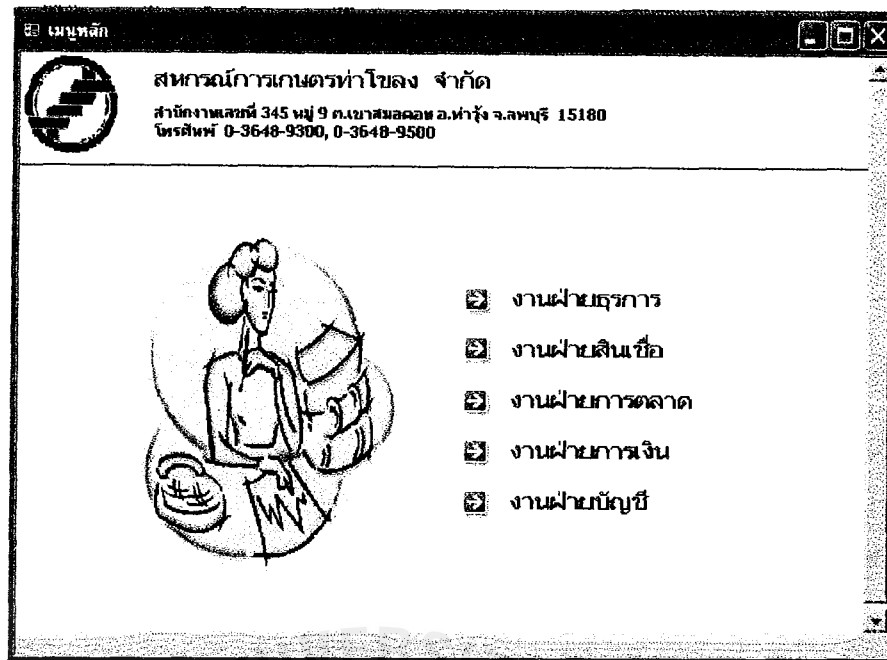

Figure 4-2 Main Menu Screen

Once the user is logged in, he/she will come to the main menu screen. Menu will contain names of 5 departments which jobs of each department will be showed after the user selects the name of the department.

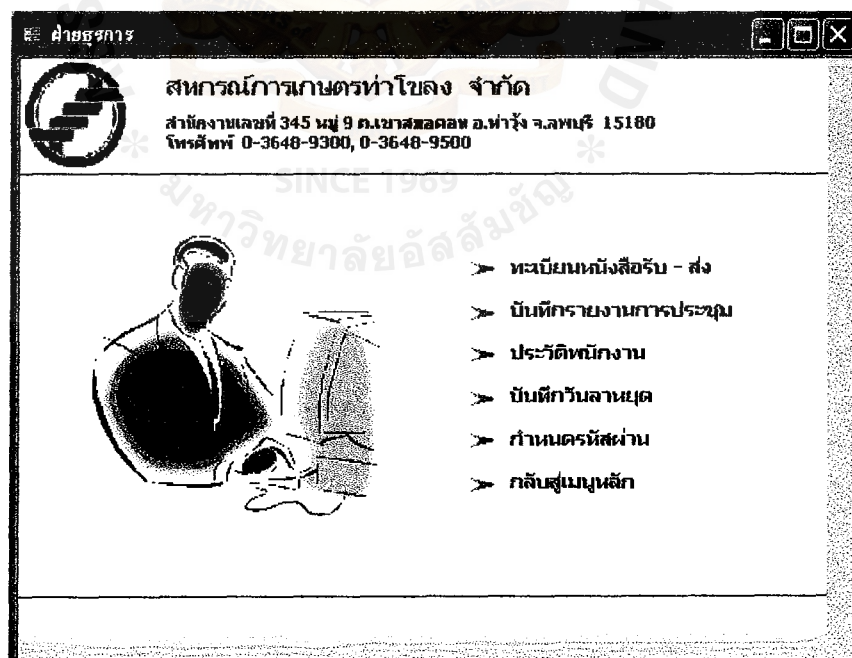

Figure 4-3 Administrative Menu Screen

When the user selects the administrative department label, the administrative menu screen is showed. It includes all responsibilities of this department, document recording, employee profile, vacation recording and login name and password assignment.

This screen is used to assign accounting code. The accountant enters new account item code. Then, they save this information into database. The system will verify this code from the accounting list file. If it is not already assigned, it will be saved.

## 4.2 Output Design

The output design requires reports and output screens that generate information or reports. It will be based on the user requirements for daily operation. The output requirements are the information that must be the result from the input requirement that can generate various reports which support the management for better decision making. The proposed system will generate main reports as follows:

การศึกษา	ป.โท(การจัดการ)	บุคคลเข้าประกัน	นายทวี ทองโต

## **CHAPTER 5**

### **PROJECT IMPLEMENTATION**

An implementation plan has been designed for the new system to help in developing a system within a specified time frame and to install it in the organization, replacing old systems and work method.

Coding: after the physical design is created, the programmer will code the program, and software components.

Testing can be done together with the coding step. The program will be tested to check whether it matches with user requirements.

Installation starts with hardware installation. Then, software would have to be installed on PC.

Conversion : I will select the parallel installation because it is risk-less. For the parallel installation, the existing system continues to run along with the new system until users are satisfied with the new system so the existing system can be turned off.

Documentation is very important. It contains all details concerning understanding of the new system and how to cope with the new system.

Training is one critical success factor in system development. We try to make familiar with the new system to users. It can reduce their belief that the new system will cause more jobs. And, users will be introduced in the right way to cope with the new system.

## **CHAPTER 6**

### **CONCLUSION AND RECOMMENDATION**

#### **6.1 Conclusions**

Thaklong Agriculture Co-operation is a growing business with increasing number of customer services. But all the functions are done manually which causes some errors and redundancy. Therefore, the idea of productivity improvement and the system adaptation have accordingly come up. Computerized System for Agriculture Co-operation is developed for resolving this problem.

The new system is designed to handle all paper work. It is used to support business activities by taking advantage of computer technology. It will help to increase speed and accuracy of business processes and customer satisfaction. Moreover, it can be decrease the errors and redundant tasks. To achieve the objectives of the project, the new system is developed by considering user requirements, system requirement, and hardware and software requirement. And, it provides security which authorizes the user entering the system. The implementation is done by matching all requirements. The developer should consider strictly about cost and time because there is limited resources.

#### **6.2 Recommendations**

- The parallel conversion has been used for this system. It ensures that the work will not fail. But it will spend too much time to finish same works because of duplication of works. So, we need to educate the users by describing the advantages of the new system.
- System maintenance should always be provided since the system needs modifying or enhancing. And the documentation must follow.

# **Computerized System for Agriculture Co-operation**

By

**Ms. Sawika Opat**

**Submitted in Partial Fulfillment of the  
Requirement for the Degree of  
Master of Science  
in Information Technology  
Assumption University**

March , 2004

# The Faculty of Science and Technology

## Master Project Approval

Project Title                      Computerized System for Agriculture Co-operation

By                                      Ms. Sawika Opat  
Project Advisor                      Asst. Prof. Dr. Thotsapon Sortrakul

Academic Year                      2/2003

---

The Department of Information Technology , Faculty of Science and Technology of Assumption University has approved this final report of the **three** credits course. **IT6900 Master Project**, submitted in partial fulfillment of the requirements for the degree of Master of Science in Information Technology .

Approval Committee:

  
(Asst. Prof. Dr. Thotsapon Sortrakul)  
Advisor

  
(Dr. Kittipong Srisansanee)  
Committee Member

  
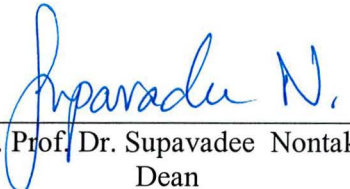

(Dr. Boonlert Watjatrakul)  
Committee Member

  
(Asst. Prof. Dr. Thiraphong Charoenkhunwiwat)  
Committee Member

---

Faculty Approval:

  
(Asst. Prof. Dr. Thotsapon Sortrakul)  
Program Director

  
(Asst. Prof. Dr. Supavadee Nontakao)  
Dean

February / 2004

## **ACKNOWLEDGEMENTS**

I would like to express my appreciation and thanks to Asst. Prof. Dr. Thotsapon Sortrakul for his encouragement and advice through the course of this project's development. I would like to thank Dr. Thatchai Chuenchom and Dr. Jirapun Dangdej for their attentive teaching on System Analysis and Design and Software Engineering course.

My thanks also go to the staff of the Faculty of Science and Technology for all the assistance throughout my curriculum. And I would like to thank all my friends who helped me correct the problems in development of the project.

Finally, many thanks for employees of Thaklong Agriculture Co-operation for their kind collaboration and assistance in providing useful information for developing the new computerized system.

## **ABSTRACT**

Thaklong Agriculture Co-operation is a medium size cooperation which has more than 1,000 members with 20 million baht of annual net-profit, but each department still performs all functions manually (paper-based). Information seeking and analyzing by human operators cause some errors and redundancy. Computerized system for the co-operation is developed for resolving this problem. This system will perform all the processes, and the functions of five departments namely administrative, loaning, finance, marketing and accounting. It is used to support business activities by taking advantage of computer technology. I believe that the new system will increase speed and accuracy of business processes and customer satisfaction. This system will replace the old manual system. To achieve these goals, it requires a sophisticated computer information system as well as database management system.

This new computer-based agriculture information system is designed to be menu-driven and highly user-friendly. The advantage of this system is it allows each department to perform jobs more efficiently and effectively by sharing information on the same database. The methodology and design of computerized system is presented in this paper. An analysis of the old system needs identifying several problems, which aids us in creating new system to meet user requirement. It is much better to create a prototype for testing system before a real implementation. Also, it is able to guarantee users satisfaction. The computer security, the indispensable part of system, is also considered in this paper.

# **CHAPTER 1**

## **INTRODUCTION**

### **1.1 Background of the Project**

Nowadays, running business requires a good way to manage the resources in organizations for efficiency and effectiveness of proceeding. Information technology (IT) has become a major facilitator of business activities in the world today. Therefore, IT is used extensively for productivity improvement of business processes.

“A computer-based information system is an information system that uses computer technology to perform some or all its intended tasks.” [1] Use of the information system is usually central to operating the business processes successfully. Information technology enables people to design and implement improvement, including new processes and facilities of increasing complexity and novelty. This project is concentrated on the work or process of agriculture co-operation system. We adapt from paper-based system to computerized system.

The computerized system for agriculture co-operation will help increase productivity of operation and save the resources of organization such as time of operation, paper and etc. Moreover, this system will increase satisfaction of customers because the time in operation is faster than the old system. And, it helps to manage the organization and plan the mission.

### **1.2 Problem Definitions**

At present, Thaklong agriculture co-operation that I use as a model is a medium sized co-operation. There are 1,000 members and the company has net-profit around 20 million baht per year. In accounting department, accountants are responsible to organize daily and annual account report. For finance department, the officers have responsibility about deposit-withdrawal money service, calculating

interest, and undertaking all works concerned. For loan department, its duty is lending out money. For marketing department, the employees are responsible for providing and selling product and organizing inventory report. For administrative department, they prepare monthly report for manager and board of co-op which is used in monthly meeting. And, they have functions about document record, employee profile and recruitment.

All the above functions are dealt manually and based on paper transaction. Although they have PCs, they just use them only for word processing and excel program which is not a worthwhile purpose. Each work takes more time in processing and often error or mistake occurs in business functions such as generating report, calculating some value in any process, recording information, etc. Accordingly, the manager and the board deem it fit to create a new computerized system for developing efficiency and effectiveness of the organization. So, the proposed system will be based on computer and Database Management System (DBMS) which enables managing and operating for maximum performance with consuming less time in many areas of work, including annual account report preparing, all jobs concerning customer services, managing budget and planning for the goal of the organization.

### **1.3 Objectives of the Project**

The objectives of the computerized system for agriculture co-operation are as follows:

- 1) To analyze the process of works of each department in order to identify the cause of problems.
- 2) To develop and implement the new computerized system to replace the existing system to enhance efficiency of business process.

- 3) To use the new system for reducing time consumption in business activities.
- 4) To increase the quality of customer service by using the proposed system.
- 5) To reduce the error in business activities and reduce the operation cost such as paper cost, human error cost and overtime payments to the employees.

#### **1.4 Scope of the Project**

The project is focused on the system adaptation to the computerized system from the old system for supporting the agriculture co-operation operations, so I separate the main functions to be main menus of the new system. Therefore, the scope of this project covers main functions that include the following:

- 1) The system will be run on two PCs which are connected in the form of peer-to-peer structure to facilitate information sharing.
- 2) The system provides functions for each department, namely loaning, accounting, marketing, finance and administrative work.
- 3) The system provides searching function by using keyword such as customer's name, customer's ID, account book no, loaning no or other keys in each activities.
- 4) The system provides performance report for the head of each department and manager.
- 5) All information will be stored in the database for supporting all the above jobs.

## CHAPTER 2

### EXISTING SYSTEM

#### 2.1 Background of the Organization

Thaklong agriculture co-operation has been established since March 1, 1985 for service members almost all of whom are farmers. Its main business concerns about loaning and deposit services and selling low-priced products for members.

Figure 2-1 Organization Chart

According to the organization chart, there are five departments which include account, finance, loaning, marketing, and administrative. The responsibilities of each department are defined as follow:

##### 1. Accounting Department

- Responsible for generating account receivable and account payable.
- Responsible for organizing daily, monthly account and annual report.

##### 2. Finance Department

- Responsible for deposit services.
- Responsible for recording stock of members.
- Responsible for paying employee salary.
- Responsible for member application.

- Responsible for generating report about deposit, stock and the number of members.

### 3. Loan Department

- Responsible for servicing loans for members.
- Responsible for generating report for controlling loan.

### 4. Marketing Department

- Responsible for providing products for selling.
- Responsible for organizing the product inventory.
- Responsible for allocating dividend of members.
- Responsible for generating report about purchased product, product inventory and dividend money.

### 5. Administrative Department

- Responsible for generating document for board meeting.
- Responsible for organizing document record.
- Responsible for recording employee profile.
- Responsible for recruitment of appropriate personnel.
- Responsible for all administrative tasks.

## 2.2 Overview of Existing Co-operation's Operating Functions

The existing system is described according to the details of operating functions of each department as follows:

In Accounting Department, accountants will collect all operating documents from other departments such as invoice, receipt, deposit and withdrawal paper, loaning receipt, etc. Then, they will summarize the account receivable and payable after service time ending (3:00 p.m.). Next, they will organize daily account report.

And, they will generate monthly and annual report for submitting to the manager, committee and auditor of Office of Inspector of Cooperative Accounts. All of this is done manually.

In Finance Department, officers will respond to customers and control stock and money in process. When members want to deposit or withdraw, they will fill the deposit or withdrawal form and place to the officer together with their accounting book. Then, the officer will continue the process of deposit or withdrawal service by using typewriter. They also will respond to new member application. They will help fill the member form and attach the copy of their ID card and census record. Then, the officer will file this data and generate member identifying book. Next, they will deal with stock holding of members which is 10 baht per stock and members will have at least 50 stocks (500 baht). They will generate monthly report about the amount of deposits, stocks and members and submit to the manager and committee by using Microsoft Excel.

In Loaning Department, members, wanting to get a loan, must mortgage their property at Land Department Office of district before loaning process is started. Then, the officer will begin with consideration of the petition. When it is admitted, the member will be contracted with the co-operation. Then, they will get money and 5% of it will be deducted to become their stock. For example, if a member borrows 100,000 baht, they will get 95,000 baht and the rest will become to his/her stock. For the repayment of a debt, the officer will process manually by using calculator and writing the detail on the loan form. They will generate monthly report for controlling loan and submit to the manager and the committee by using Microsoft Excel.

In Marketing Department, officers will generate receipt when a member purchases products such as rice, paddy seeds, chemical fertilizers, and gasoline. And,

they will provide products for sales. They will contact the supplier and propose price to the manager for approval. Then, they will buy products. After that, they will record information in the product purchasing book. They will organize product inventory every day. At the year-end, they will allocate dividend by looking from total of products purchased by members. All of the process is done manually.

In Administrative Department, officers deal with all the works that are related to employees and the whole office. They will prepare and generate documents for board meeting by using Microsoft Word. They will organize the document number for both received-document and sent-document. Then, they continue to record the document number in file by hand writing. They are also responsible for employee profile recording.

### **2.3 Areas for Improvement**

As I described in the problem statement above, there are sequential problems namely inaccurate data, redundant tasks, inefficient report and unsatisfied customer.

So, I will determine the areas of improvement as follows:-

2.3.1 To provide data accuracy. The proposed system will provide calculating and managing information accuracy because the proposed system will be based on computerized program (Microsoft Access program) which has high capability in information management.

2.3.2 To reduce task redundancy. The proposed system is designed to reduce tasks in generating reports. It can generate report automatically by using information from system database instead of reentering.

2.3.3 To increase customer satisfaction. Therefore, the proposed system can reduce the time of processing customer services that can improve customer satisfaction.

The proposed system can respond to the organization's requirements and resolve the problems of the existing system. It helps reduce time consuming in operating. It is developed to adapt the existing system functions to become a computerized system for supporting the agriculture co-operation's operations.

## **CHAPTER 3**

### **PROPOSED SYSTEM**

#### **3.1 Project Methodology**

“The System Development Life Cycle (SDLC) is a model for developing a system by dealing with sequential steps and options for revisiting steps when problems appear.” [2] So, I use SDLC as a model to develop this proposed system of co-operation. There are 6 phases in this methodology:

- Project identification and selection

In this phase, I will identify needs of the company and the proposed system. Then, I will determine the priority of the need and plan to schedule the activities of system development.

- Project initiation and selection

I will explain why the system should be developed and define the problem of the old system. Then, I will determine the scope of the proposed system. Next, I will start to plan the step for developing the system by using the SDLC steps. And, I will determine the cost of developing and benefit of the project.

- Analysis

The first thing that I do on this phase is requirement determination after I interviewed with users about requirements that they need from the proposed system. Then, I will study the old system for comparing with user's want. Next, I will generate initial design to match the requirements within cost and technical levels.

- Design

I will design the new system in all aspects from input, output, database, and computer processes which must be suitable with hardware and software specification.

- Implementation

Coding is the first work of this step. After that, I will progress to test the system until it meets the acceptance of user in each department. Next, I will check security of personnel who can access the system. Then, I start to install the new system by using parallel installation. And, I will organize the documentation and training for users.

- Maintenance

When the system is being operated, users may find problems with work process and want a better ways to perform their functions. So, the programmer will modify the system for responding to the changing business conditions.

### **3.2 User Requirements**

In the process of collecting the requirements, I obtain it by interviewing group of users and using the existing system operation. This system is developed for responding their routine jobs. The requirements are concluded as follows:-

1. All information is provided with accuracy such as the details of members, deposit and loan process, product, selling and account.
2. To reduce human error in operation which can lead to waste of time and money. The users want the system that has accuracy in calculating and retrieving information.
3. To improve the speed in operation, this system will reduce the steps of business functions.

4. Input and output screen should be designed with user friendly interface.
5. The user should be able to easily generate any report on a daily, monthly or yearly basis.

### 3.3 System Requirements

1. The new system should have security control in operation by having login page that can verify the user name and password.
2. The system should be menu driven and the function should be user friendly so the users, having low computer skill, can also work with it.
3. The form and report should be generated in a standard way because the Department of Inspector of Cooperative Accounts will assign the documents in easy-to-audit format.

### 3.4 Hardware and Software Requirements

- Workstation (2 units)
  - 128MB DDR-RAM
  - 40GB HDD
  - CD Drive: 52X
  - Monitor 15"
  - Embedded VGA AGP 32MB (1 AGP slot available)
  - Built-in 3D sound
  - 10/100 Mbps built-in LAN
  - Mouse and Keyboard
- Dot Matrix Printer
- Printer sharing box
- UPS
- Operating System: Windows 2000 or latest version

- DBMS: Microsoft Access 2000
- Development Tool: Microsoft Access 2000

### 3.5 Cost and Benefit Analysis

“The purpose for accessing economic feasibility is to identify the financial benefits and costs associated with development of the project. Economic feasibility is often referred to as cost-benefit analysis. It helps in decisions on spending or investment by determining if it is the worthwhile to develop a project or not.” [2]

#### 3.5.1 Benefit Analysis

An information system can provide many benefits to an organization. The new system can automate routine jobs, reduce errors, provide innovative customer services, and improve organizational efficiency, speed, and flexibility.

The benefits of the system are classified as tangible and intangible:

1. Tangible benefits are benefits that can be measured in terms of profit to the company. The following benefits could be derived from the proposed system:-

- Reduce overtime cost

Because of using the new computerized system, it can increase the speed of business processes and it can reduce error of works such as deposit and withdraw service, loaning service, accounting and inventory. These works used to take more time in processing and sometimes errors occur in the existing system. On average, employees work overtime around 2 months per year because they have to prepare the information which begins from mid of January to end of March for generating their annual reports so they must work overtime to finish their works by the fiscal year-end (end of March).

Therefore, the organization must pay overtime cost approximately 140,000 bath which equals to 2 month salary of all employees. When the organization begins to use the new system, it can save this overtime cost.

- Reduce cost of papers

The organization pay cost of papers around 100,000 bath per year. Normally, the existing system stores all information on papers or books so when we change to use the new computerized system every report can be updated and generated on database without printing everything. Calculating data and collecting information are done on the notepad so the new system can reduce 30 percent of paper cost. Therefore, using the new system can save 30,000 bath in paper cost.

**Table 3-1 Tangible benefits worksheet**

<b>TANGIBLE BENEFITS WORKSHEET</b>	
<b>COMPUTERIZED SYSTEM FOR AGRICULTURE CO-OPERATION</b>	
	Year 1 through 5
A. Reduce overtime cost	140,000
B. Reduce cost of papers	<u>30,000</u>
<b>TOTAL tangible benefits</b>	<b><u>170,000</u></b>

2. Intangible benefits are benefits which are believed to be difficult or impossible to quantify such as improving efficiency and effectiveness of business functions, increasing user satisfaction, supporting to generate report for manager for decision making, and improving user's computer skill.

### 3.5.2 Cost Analysis

The major cost analysis can be classified into 2 types:

- “One-Time Costs refer to those associated with project initiation and development and the start-up of the system such as system development, new hardware and software purchase, users training, site preparation and data or system conversion.” [2]
- “Recurring Costs refer to those costs resulting from the ongoing evolution and use of the system such as application software maintenance, incremental data storage expense, and incremental communications.” [2]
- The estimated costs and benefits over the period are discounted to present day values using a range of discount rates (5 percent rates). Now, Thaklong Agriculture Co-operation uses a discount rate of 10 percent for interest because the co-operation has to borrow money from bank at 5% interest. So they had to add another 5% for their profits.

Project Feasibility Study  
Economic Feasibility Analysis

BENEFITS	
Reduce overtime cost	140,000.00
Reduce cost of papers	30,000.00
TOTAL BENEFITS	<u>170,000.00</u>
ONE TIME COSTS	
1. HARDWARE	
3 PC & Accessories	84,000.00
2 UPS	7,500.00
1 Printer sharing box	8,000.00
1 Dot-Matrix Printer	11,500.00
Total Cost of Hardware	<u>111,000.00</u>
2. SOFTWARE	
Microsoft Window 2000 workstation	15,000.00
Microsoft Office 2000	28,000.00
Total Cost of Software	<u>43,000.00</u>
3. DEVELOPMENT & CONSULTANT	
System Analysis and Requirement Determination	15,000.00
System Design	25,000.00
Implement	15,000.00
Total Cost of Development & Consultant	<u>55,000.00</u>
4. INSTALLATION & TRAINING	
Installation	10,000.00
Training & Document	15,000.00
Total Cost of Installation & Training	<u>25,000.00</u>
TOTAL ONE TIME COSTS	<u>234,000.00</u>
RECURRING COSTS	
Application Software Maintenance	18,500.00
Hardware Maintenance	7,500.00
Supplies	20,000.00
TOTAL RECURRING COSTS	<u>46,000.00</u>

**Figure 3.1** Benefits and Costs of the Project

**Economic Feasibility Analysis**  
**Computerized System for Agriculture Co-operation**

	Year of Project						
	Year 0	Year 1	Year 2	Year 3	Year 4	Year 5	TOTALS
Net Economic Benefit	0	170,000	170,000	170,000	170,000	170,000	
Discount(10%)	1.0000	0.9091	0.8264	0.7513	0.6830	0.6209	
PV of Benefit	0	154,545	140,496	127,724	116,112	105,557	
<b>NPV of all BENEFITS</b>	0	154,545	295,041	422,765	538,877	644,434	644,434
<b>One-Time Costs</b>	(285,000)						
Recurring Costs	0	(46,000)	(46,000)	(46,000)	(46,000)	(46,000)	
Discount(10%)	1.0000	0.9091	0.8264	0.7513	0.6830	0.6209	
PV of Recurring Costs	0	(41,818)	(38,017)	(34,560)	(31,419)	(28,562)	
<b>NPV OF ALL COSTS</b>	(285,000)	(326,818)	(364,835)	(399,395)	(430,814)	(459,376)	(459,376)
<b>Overall NPV</b>							<u><u>185,058</u></u>
<b>Overall ROI - (Overall NPV / NPV of all COSTS)</b>							<u><u>0.40</u></u>
<b>Break-even Analysis</b>							
Yearly NPV Cash Flow	(285,000)	112,727	102,479	93,163	84,694	76,994	
Overall NPV Cash Flow	(285,000)	(172,273)	(69,793)	23,370	108,063	185,058	

Project break-even occurs between year 2 and year 3

Use first year of positive cash flow to calculate break-even function -  $((93,163 - 23,370) / 93,163) = 0.75$

Actual break-even occurred at 2.75 years

**Figure 3.2** Summary Spreadsheet reflecting the present value calculations of all benefits and costs for the proposed system

### 3.5.3 Break-even Analysis

The Break Even Analysis shows at what point benefits equal cost. According to figure 3.2, the break-even point is occurred between year 2 and 3.

$$\text{Break-Even Ratio} = \frac{\text{Yearly NPV Cash Flow} - \text{Overall NPV Cash Flow}}{\text{Yearly NPV Cash Flow}}$$

Project break-even occurs between years 2 and 3

$$\text{Break-Even Ratio} = \frac{93,163 - 23,370}{93,163} = 0.75$$

Actual break-even occurred at 2.75 years

Figure 3.3 Break even point

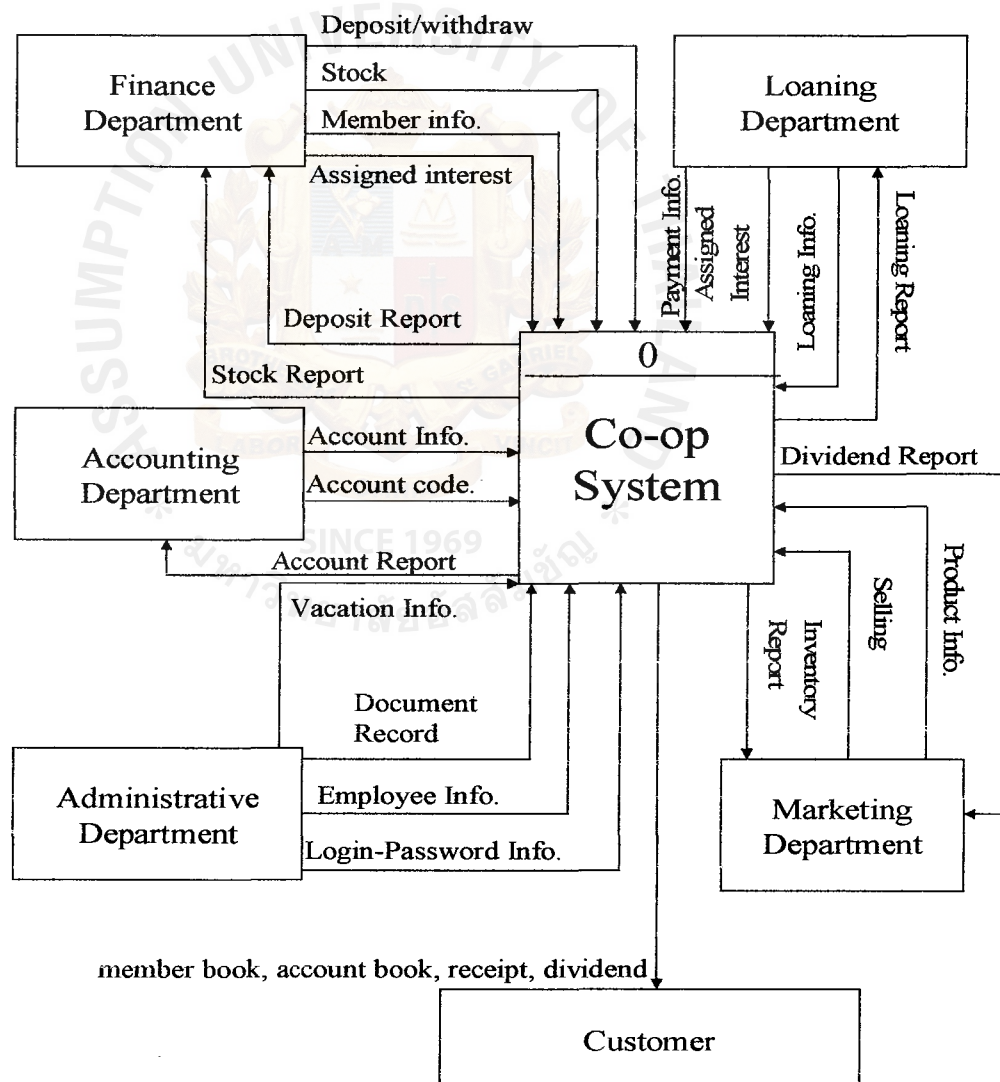

### 3.6 System Design

#### 3.6.1 Database Design

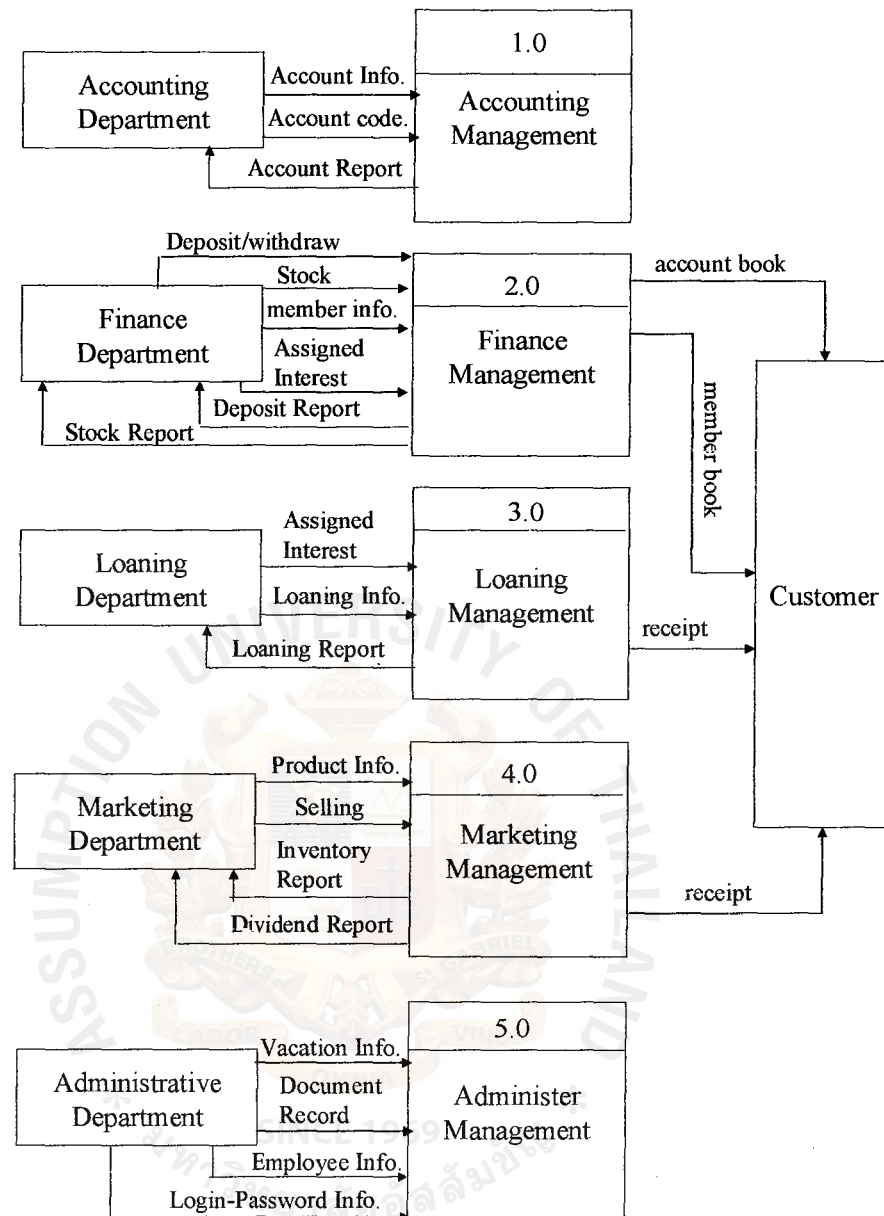

The proposed system is created as a relational database. It uses Microsoft Access 2002 as a tool for database management.

#### 3.6.2 Data Flow Diagram of the proposed system

A Data Flow Diagram is a tool of process modeling, which helps to view overall data flow in the system. I will show the Data Flow Diagram of the proposed system as follows:

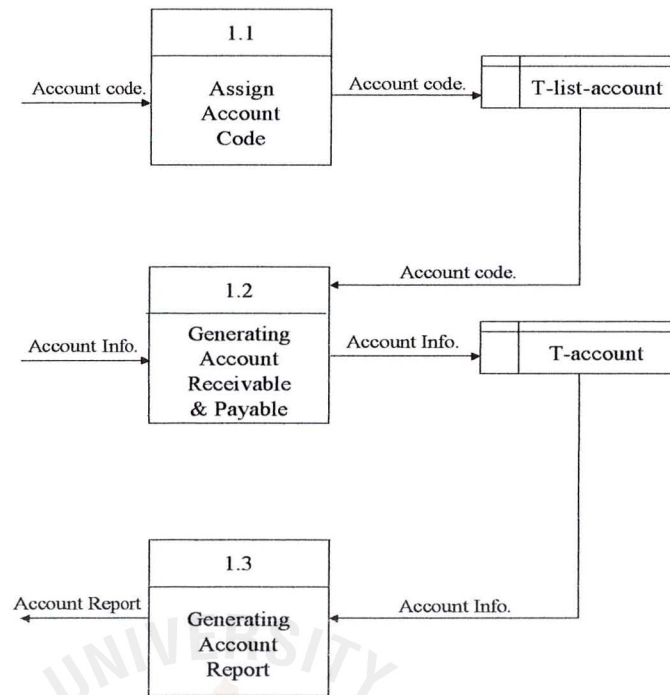

**Figure 3.4** Context Diagram of the proposed system

**Figure 3.5** Data Flow Diagram of the proposed system at Level - 0

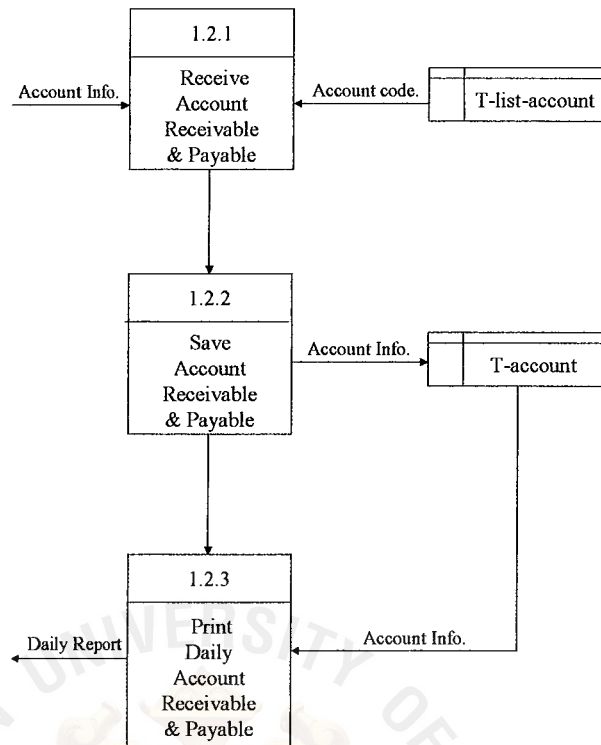

**Figure 3.6** Data Flow Diagram of the proposed system at Level – 1 Process 1

**Figure 3.29** Data Flow Diagram of the proposed system at Level – 2 Process 5

**Figure 3.30** Data Flow Diagram of the proposed system at Level – 2 Process 5

**Figure 3.31** Data Flow Diagram of the proposed system at Level – 2 Process 5

### **Process 1**

There are 3 main functions in Accounting Department. First, assigning accounting code to the accountant to enter a new account. The system has to check it from the list of account database. If it is not already assigned, it will be saved. Generating account receivable & payable is the second function. It starts at account information receiving then save it into account database. After that, we will print the daily account report. At last, we will enter key for selecting type of report that we want to print. Then, we will use that key in selecting data for generating report. After that, the report is printed.

### **Process 2**

This process include Finance Department's functions such as account-book opening, deposit/withdrawal processing, assigning interest on deposit, new member registration, stock operating and report generating. All functions will start with entering the concerned information. Then, the information will be saved into database. When we want to print any report, we just enter keyword for selecting the type of report. Then, the report will be generated by retrieving information from database.

### **Process 3**

When loan process begins, the officer will enter loan information such as mortgage and loan detail. Then, all information will be saved into database. And, 5% of the amount of loan is deducted to become the stock of this customer. After that the receipt is generated and printed. To repay a debt, the officer will enter loan ID. And, it is used as the key to retrieve information from database. Then, the system will calculate the amount of money that the member must pay. Next, the amount that the member has to repay is entered and saved into database. Then, the system will generate the receipt. For generating report, we will enter key for selecting type of

report that we want to print. Then, we will use that key in selecting data from database for generating report. After that, the report is printed.

#### **Process 4**

After we purchase products for sales, we will record the details into product and inventory files. In selling products, the officer will receive order from customers and they will enter it into the system. After that, the system will generate the receipt for customer and save order information into database. The order information is used to calculate dividend for members at the end of the year. For report generating, we will enter a key for selecting type of report that we want to print. Then, we will use that key in selecting data for generating report. After that, the report is printed.

#### **Process 5**

Document recording is used for keeping memorandum of the document details that are sent or received and the number of document. If the officer wants to file the employee profile, he can enter employee data into the system. Then, the system will progress to save this information into database. About vacation, the officer will enter vacation information. Before this information is recorded, the system will check the historical vacations. The administrators are assigned with the login name and password for system authorization. They enter the login information and the system will check it for protecting repeated information. When it is already proved, it is saved into database.

### 3.7 Proposed Schedule

Project Activities	November				December				January				February		
	1	2	3	4	1	2	3	4	1	2	3	4	1	2	3
1.Preliminary study	←		→												
1.1 Difining problems	■														
1.2 Gathering requirements		■													
1.3 Determining scope of the proposed system			■												
2.Analysis and design				←			→								
2.1 Analyzing system need				■	■										
2.2 Design interface						■									
2.3 Design database							■								
3.Program coding								←			→				
3.1 Coding								■	■	■	■	■			
4.Testing												←		→	
4.1 Individual testing												■			
4.2 Integrate testing												■	■		
5.Prepare project document													←		→
5.1 Summerize the information													■	■	
5.2 Generate project document													■	■	■
5.3 Defense project															■

Figure 3.32 Proposed Schedule

## CHAPTER 4

### INPUT AND OUTPUT INTERFACE DESIGN

#### 4.1 Input Design

User interface design is the specification of a conversation between the users and the computer system. For this system, the input screen is designed by using graphical user interface (GUI) which is mostly used in the system development today. GUI environment can provide user friendly interface and various form of designed screens. The GUI controls such as text box, combo box, command button, etc. provide more flexibility in operation designing and data attribute showing.

Figure 4-1 Log-in Screen

The first screen starts from the Log-in page in order to verify the authorized users. Users will be assigned with their own user name and password. If the user name and password is not correct, the system will notify the user. After verifying, the next screen will be the main menu.

Figure 4-2 Main Menu Screen

Once the user is logged in, he/she will come to the main menu screen. Menu will contain names of 5 departments which jobs of each department will be showed after the user selects the name of the department.

Figure 4-3 Administrative Menu Screen

When the user selects the administrative department label, the administrative menu screen is showed. It includes all responsibilities of this department, document recording, employee profile, vacation recording and login name and password assignment.

**Figure 4-7 Login Registration Screen**

For the login registration screen, the administrators are assigned with the login name and password for system authorization. After they enter the login information, the system will check it for protecting repeated information. When it is already proved, it is saved into database.

**Figure 4-8 Loaning Menu Screen**

In this screen, it shows all functions of loan department from which a user can choose what processes they want to use. It consists of loan service, repayment of debt and interest, loan reports and assigning loan interests.

When the officer selects loan process, he/she will enter mortgage information on the mortgage detail screen and save it. Next the loan detail screen is showed and the officer will enter the loan information. Five percent from the amount of loan is deducted and it becomes the stock of this member. Then, all information will be saved into database. After that the receipt is generated and printed. Figure 4-9 and 4-10 show this process.

**Figure 4-11 Loaning Payment Screen**

To repay a debt, the officer will enter loan type and loan ID. And, it is used as the key to retrieve information from database. Then, calculate interest button is clicked and the system will calculate the interest that the member must pay. Next, the amount that the member has to pay is entered and save it into database. Then, the system will generate the receipt.

**Figure 4-12 Assign Interest Screen**

This screen is used for loan interest assignment. The officer will assign the loan interest when the interest is changed which depends on the market circumstances and resolution of board. Then, this interest rate is saved into the database for loan calculation.

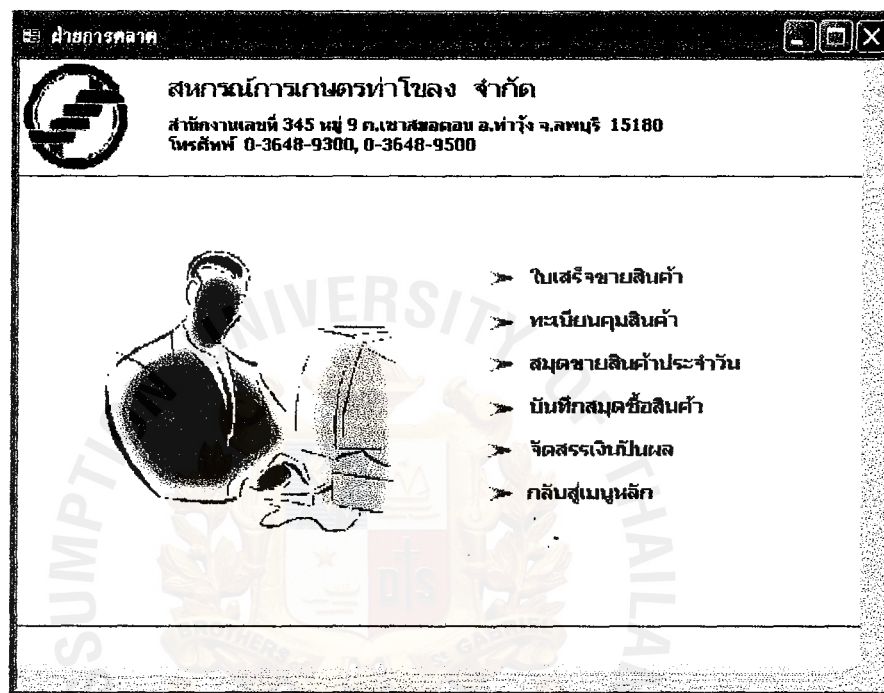

Figure 4-13 Marketing Menu Screen

When the user selects the marketing department label, the marketing menu screen is showed. It includes all responsibilities of this department, selling product, recording purchased product and controlling inventory.

**Figure 4-25 Assign Accounting Code Screen**

This screen is used to assign accounting code. The accountant enters new account item code. Then, they save this information into database. The system will verify this code from the accounting list file. If it is not already assigned, it will be saved.

## 4.2 Output Design

The output design requires reports and output screens that generate information or reports. It will be based on the user requirements for daily operation. The output requirements are the information that must be the result from the input requirement that can generate various reports which support the management for better decision making. The proposed system will generate main reports as follows:

- Daily Account Repot

## **CHAPTER 5**

### **PROJECT IMPLEMENTATION**

An implementation plan has been designed for the new system to help in developing a system within a specified time frame and to install it in the organization, replacing old systems and work method.

Coding: after the physical design is created, the programmer will code the program, and software components.

Testing can be done together with the coding step. The program will be tested to check whether it matches with user requirements.

Installation starts with hardware installation. Then, software would have to be installed on PC.

Conversion : I will select the parallel installation because it is risk-less. For the parallel installation, the existing system continues to run along with the new system until users are satisfied with the new system so the existing system can be turned off.

Documentation is very important. It contains all details concerning understanding of the new system and how to cope with the new system.

Training is one critical success factor in system development. We try to make familiar with the new system to users. It can reduce their belief that the new system will cause more jobs. And, users will be introduced in the right way to cope with the new system.

## **CHAPTER 6**

### **CONCLUSION AND RECOMMENDATION**

#### **6.1 Conclusions**

Thaklong Agriculture Co-operation is a growing business with increasing number of customer services. But all the functions are done manually which causes some errors and redundancy. Therefore, the idea of productivity improvement and the system adaptation have accordingly come up. Computerized System for Agriculture Co-operation is developed for resolving this problem.

The new system is designed to handle all paper work. It is used to support business activities by taking advantage of computer technology. It will help to increase speed and accuracy of business processes and customer satisfaction. Moreover, it can be decrease the errors and redundant tasks. To achieve the objectives of the project, the new system is developed by considering user requirements, system requirement, and hardware and software requirement. And, it provides security which authorizes the user entering the system. The implementation is done by matching all requirements. The developer should consider strictly about cost and time because there is limited resources.

#### **6.2 Recommendations**

- The parallel conversion has been used for this system. It ensures that the work will not fail. But it will spend too much time to finish same works because of duplication of works. So, we need to educate the users by describing the advantages of the new system.
- System maintenance should always be provided since the system needs modifying or enhancing. And the documentation must follow.
