

## ABSTRACT

This project's objectives are to design an integrated database system, since it is a challenging task. It comprises database design for finance unit in order to minimize redundancy. Integration of separately designed database to fulfill management requirement needs both technical and managerial skills.

On the technical side, it must be ensured that excel spreadsheet conversions to the financial analysis system are correct. A mapping from the reconciliation of the last figures is needed. From experience at Finance Unit, Family Health International, Asia Regional Office, a software tool for these integration and mapping tasks are proposed and developed. This project describes the design and development of the software tool and the integration of the actual systems at Finance Unit, Family Health International, Asia Regional Office.

There is also the graphic integration on the financial analysis diagram screen to support management level for making decision to be easier, because the project collects the data entity in the form of tables.
