

ABSTRACT

Institute of Information Technology development (ITIT) is a computer training company of Thailand. It has provided computer training to both individual customer and corporate customer. For corporate training, the training is set up in the customer 's company and a lot of training processes are required with limited training facilities and higher cost of training. Therefore, this project is to develop an effective information system to facilitate the process of computer training system

The current existing computer training system is based on manual training system. Most training courses are set up at the customer's company. There are general problems of a manual training system which are lack of knowledge IT people to follow up the problems during training and students have limited date and time for training. Moreover, students have to pay higher training fee in each training course.

The new proposed computer training system will be developed to replace the manual training system with web-based training system. It can help students to correct the problems and student can study any time. Moreover, the new system also reduces the training fee in each training course.
