TEMPORAL KNOWLEDGE USING CONCEPTUAL GRAPH

A thesis presented to the department of Computer Science in partial fulfillment of
the requirement for the degree Master of Science in Computer Science

Tanakarn Saithong

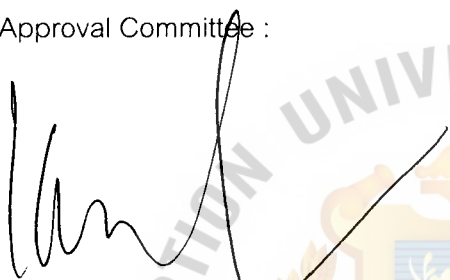

September, 1998

Master Thesis Title : Temporal Knowledge Using Conceptual Graph

By : Mr. Tanakarn Saithong

The Department of Computer Science, Faculty of Science and Technology, Assumption University had this final report of the 12 credit course, SC 7000 : Master Thesis, submitted in partial fulfillment of the requirement for the degree of Master of Science in Computer Science.

Approval Committee :

(Dr. Tang Van To)

Thesis Advisor

(Asst. Prof. Dr. Pratit Santiprabhob)

Committee Member

(Dr. Thitipong Tanprasert)

Committee Member

(Asst. Prof. Dr. Somnuk Keretho)

Representative of Ministry of University
Affairs

ACKNOWLEDGEMENTS

The author wishes to express his sincere thanks and deep sense of gratitude to his advisor Dr. Tang Van To for his constant guidance and moral support throughout the period of this thesis work.

The author wishes to convey special thanks to his committee members Dr. Pratit Santiprabhob and Dr. Thitipong Tanprasert for their constructive criticisms and useful suggestions, and thanks to Dr. Somnuk Keretho, an external committee member from Ministry of University Affairs, for his constructive suggestions.

Sincere thanks are also for all faculty members, staffs and secretaries of the Department of Computer Science for their help and kindness.

Many thanks to friends in ABAC for their encouragement throughout the study at ABAC.

Finally, no word can express the contribution of the author's family. Their continued love and encouragement throughout the study was the backbone behind the success of the author in study.

ABSTRACT

Temporal knowledge is the knowledge about time of the events and the temporal relationships between events. The temporal knowledge engine allow us to infer the temporal knowledge and temporal relationships.

In this study, a CG model for representing temporal knowledge is studied, a mapping from CG to RDBMS tables also is derived. A simple program for input, edit, display and query on the temporal knowledge is written in Visual Basic, and an inference engine in Prolog is also developed. These two programs are interacted through text files. The engine allows us to reason the possible time of event based on the temporal knowledge available in the knowledge base, it also can deliver the topological order of events.

CHAPTER 1

INTRODUCTION

1.1 STATEMENT OF THE PROBLEM

For many years, one of the research topics of artificial intelligence has been developed for knowledge representations. In order to make knowledge suitable for processing by computers, many knowledge representation method have been developed. Among them are production rules, frames, scripts, predicate transition networks, and conceptual graphs.

Conceptual Graph (CG) proposed by SOWA (1984) is a knowledge representation language base on linguistics and it attends to incorporate concepts in natural and formal languages. This knowledge representation scheme which has gained more attention recently is a general framework model for representing knowledge, and it can be used as a main model of future integrated knowledge systems [FARGUES et al.(1986)].

CG model generalizes many ideas contained in preceding works on natural language semantics and knowledge representation [JACKMAN and PAVELIN (1988)]. A system of logic for representing natural language semantics, the mapping from natural language to CG is shorter, simpler, and more direct than the mapping to calculus predicate [SOWA (1991)].

In many situations, it may be difficult to map data in precise form. In order to represent the time of events, and attempt to mix the temporal knowledge and natural language processing to CG. Temporal knowledge specifies the time of the event. It

allows us to infer the order of events that happened. Another feature is to formulate CG programs to be usable as a programming language, as predicate logic does. It will be very useful to a wide range of application fields if temporal knowledge can also be used as a programming language.

Therefore, in this study I propose to study the CG, and the possibility to apply to temporal logic. The study emphasizes on the structure of CGs, operations on CGs, how to map CG to RDBMS, how to map temporal knowledge to CGs and how to inference about the temporal knowledge on CGs. And if it is possible how to make the Q/A systems using CGs. My main research try to find a common approach. It can be used to map from temporal knowledge to RDBMS tables, which is easy to query and implement.

1.2 OBJECTIVES AND SCOPE OF THE STUDY

The main objectives of this study are :

1. Study the foundation of CG Graph and its application.
2. Study a temporal knowledge such as temporal logic and temporal relations.
3. Mapping the sentence with the temporal knowledge to conceptual graph.
4. Develop the temporal knowledge inference engine.
5. Finally, a program allows to infer about temporal relationship occurring time of events is developed.

CHAPTER 2

CONCEPTUAL GRAPH AND TEMPORAL KNOWLEDGE

In this chapter, definition and representation of CG are reviewed in Section 2.1, the process of mapping sentences to CGs is discussed in Section 2.2 and Section 2.3. Time interval, temporal object, temporal relation and temporal logic of temporal knowledge are discussed in Section 2.4.

2.1 CONCEPTUAL GRAPH

Conceptual Graphs (CG) are graph-based notations with a fundamental formal basis that can be used for knowledge representation and computer based reasoning. The formalism of CG reviewed here is based on SOWA (1984).

2.1.1 Definition

CG is formally defined as a *finite, connected, bipartite graph*. The two kinds of nodes are *concepts* and *conceptual relations* (CR). Every CR has one or more arcs, each of which must be linked to some concepts. A single concept by itself may form a CG [SOWA (1984)].

It should be noted that the difference between concept types and concept instances as:

- a) Concept types represent classes or types of entities, attributes, states and events.
- b) Concept instances (individual concept) or references is an instantiation of a concept type.

- b) Concept instances (individual concept) or references is an instantiation of a concept type.

2.1.2 Representation of Conceptual Graph

There are two forms of display for CGs [SOWA (1984)] :

- a) Graphical form : In this form a concept node is represented by a rectangle and CR is represented by an oval.

Figure 2.1 : Graphical Form of Display.

- b) Linear form : In this form a concept node is represented by [] and CR by ().

[PERSON : John] ← (Agnt) ← [PLAY] → (Obj) → [TENNIS]

Figure 2.2 : Linear Form of Display.

As mentioned in 2.1.1 definition, a conceptual node itself may form a CG, in this case a CG becomes a compound graph.

2.1.3 Atomic Conceptual Graph

Atomic Conceptual Graph (ACG) [ELLIS (1991)] is a CG that contains no logical connective and no quantifier other than the implicit existential quantifiers (Fig 2.3). An ACG containing only individual references in all the concept nodes is termed as a *ground ACG* (Fig 2.4).

[PERSON] ← (Agnt) ← [SIT] → (Loc) → [PLACE]

Figure 2.3 : An Atomic Conceptual Graph.

[PERSON : Bill] ← (Agnt) ← [SIT : #543] → (Loc) → [PLACE : Shop]

Figure 2.4 : A ground ACG, All Concept Nodes Contain Individual References.

2.1.4 Compound Graph

A CG is called a *Compound graph* [SOWA (1984)], if any or all of the following conditions hold :

- It contains contexts of depth higher than 0,
- It contains atomic CG connected by coreference links. Coreference link is used to connect identical concepts. It is shown using a dotted line in the graphic form.

Example 2.1 A Compound graph for “A person would go to ABAC, if he is a student of ABAC.”

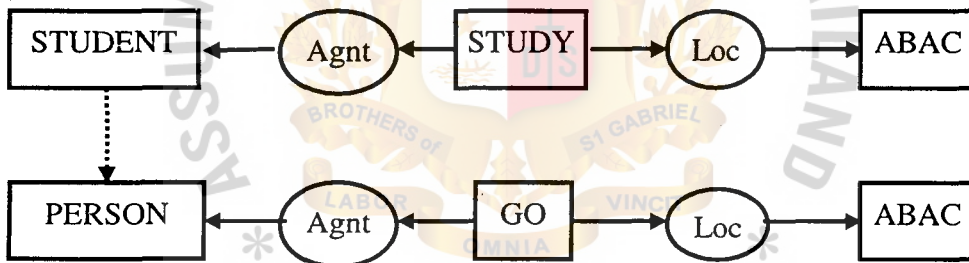

Figure 2.5 : A Compound Graph for “A person would go to ABAC, if he is a student of ABAC”.

2.2 MAPPING SENTENCE TO CONCEPTUAL GRAPH

2.2.1 Types of References

There are extended references. They correspond to generalized determiners in natural languages : existential, individual, named individual, unique existential, definite reference, set, generic set, etc. The use of these references, which provides more flexibility in natural language representation but without semantic interpretation [SOWA (1993)]. The typically extended references is show in table 2.1

| Type of reference | Example | English reading |
|---------------------|------------------------|-----------------------|
| Universal | [CAT : \forall] | every cat |
| Singular | [CAT : @ 1] | exactly one cat |
| Generic set | [CAT : { * }] | Cats |
| Counted set | [CAT : { * } @ 3] | three cats |
| Set of individuals | [CAT : { Yoyo, Meaw }] | Yoyo and Meaw |
| List of individuals | [CAT : <Yoyo, Meaw>] | Yoyo and then Meaw |
| Question | [CAT: ?] | which cat ? |
| Plural question | [CAT: { * } ?] | which cats ? |
| Measure | [Interval: @ 5 sec] | interval of 5 seconds |

Table 2.1 : Types of References.

2.2.2 Mapping Aspects

We shall illustrate several aspects of the system. Each feature is accompanied with several examples [Sait and Jame (1993)].

2.2.2.1 Subject-Verb Agreement : The translator obeys all basic English grammar rules, including the subject and verb agreement rule.

a) John lives in Bangkok.

[PERSON : John] \leftarrow [LIVE] \rightarrow [CITY : Bangkok]

b) There exist John and Jane living in Bangkok.

[PERSON: ()P { John, Jane } @2] \leftarrow [LIVE] \rightarrow [CITY : Bangkok]

2.2.2.2 Tenses : The default tense of the translator is Present (Progressive) Tense. However, the system is capable of handling other English language tenses as well.

a) John was speaking.

(PAST PROGRESSIVE) \rightarrow { [PERSON: John] \rightarrow [SPEAK] }

b) Bob lived in the Bangkok.

(PAST PROGRESSIVE) $\rightarrow \{ [\text{PERSON:Bob}] \leftarrow [\text{LIVE}] \rightarrow [\text{CITY: Bangkok}] \}$

c) John is speaking.

(PRESENT PROGRESSIVE) $\rightarrow \{ [\text{PERSON: John}] \rightarrow [\text{SPEAK}] \}$

d) John is talking to Bob.

(PRESENT PROGRESSIVE) $\rightarrow \{ [\text{PERSON : John}] \rightarrow [\text{TALK}] \rightarrow [\text{PERSON : Bob}] \}$

2.2.2.3 Cardinality Information : The examples below show the importance of this field in natural language translation :

a) There exists a person.

$[\text{PERSON : } ()P \{ * \} @1]$

b) There exist 1 to 5 persons.

$[\text{PERSON : } ()P \{ * \} @1-5]$

c) There exist at least 3 persons.

$[\text{PERSON : } ()P \{ * \} @3-\infty]$

d) There exist 2 to 3 persons among John, Jane, and Jill.

$[\text{PERSON : } ()P \{ \text{John, Jane, Jill} \} @2-3]$

e) The year 1997 consists of exactly 365 days.

$[\text{YEAR : 1997}] \leftarrow [\text{CONSIST}] \rightarrow [\text{DAY : } ()D \{ * \} @365]$

2.2.2.4 Cardinality is not always needed : There are some cases, however, where cardinality information can be omitted, resulting in more natural translations.

For example : There exist persons John and JANE.

$[\text{PERSON : } ()P \{ \text{John, Jane} \} @2]$

2.2.2.5 Simple Disjunctions : The Conceptual Structure notation is capable of handling disjunctions as well, again through the cardinality information.

For example : There exists persons John or Jane.

[PERSON : ()P {John, Jane} @1]

2.2.3 Hierarchical Links [Sait and Jame (1993)]

2.2.3.1 Link between individual concepts. There are two kind of links between individuals.

a) Relation corresponding to individual role.

For example : There is a person who walks.

[PERSON:*X] ← [AGT] ← [WALK:*Y]

b) Cross-reference link between two individuals, to express the same object.

For example : There is a person named Mary, she is a teacher.

[PERSON : "Mary", *X] [TEACHER:*X]

2.2.3.2 Link from a prototype to an individual concept.

For example : Every elephant is grey.

[ELEPHANT:∀] → [COLOR] → [COLOR : gray]

2.2.4 Canonical Formations of Conceptual Graphs

Canonical graphs is a CG that specifies the constraints on the pattern of concepts and relations that may be linked to a concept and relation type.

There are four canonical formation rules for deriving a CG w from CG u and v (where u and v may be the same graph) [SOWA (1984)]. Assume that u and v are two CGs in Fig 2.6.

Figure 2.6 : Two CGs “A student plays tennis” and “The person John plays at ABAC”.

2.2.4.1 Copy(u, w) : The copy rule allows us to form a new graph, w, that is the exact copy of u.

2.2.4.2 Restrict(u:c, w:c) : Let c be a concept of u that is not nested inside any context and with a reference that is either a constant or an existential quantifier. Then w is u with c restricted either by type or by reference : restriction by type replaces the type label of c with some subtype; and restriction by reference replaces an existential quantifier with a constant. From Fig 2.6 we can replace PERSON with STUDENT, and represented in Fig 2.7, called restriction by type.

Figure 2.7 : The Graphs Obtained After Restriction.

2.2.4.3 Join(u:c, v:d, w:c) : The join rule lets us combine two graphs into a single graph. Let c be a concept of u and d a concept of v, where neither c nor d is nested inside a context and both c and d have identical type and reference fields. Then w is the graph obtained by deleting d and linking to c all arcs of CRs that had been linked to d. From Fig 2.6 we can join CG u and CG in Fig 2.7 by delete concept STUDENT in u and represented in Fig 2.8.

Figure 2.8 : The Graph Obtained After Join.

2.2.4.4 **Simplify(u:r, u:s, w:r)** : w is u where one of a pair of duplicate CRs in u has been deleted. Two CRs r and s in the graph u are said to be duplicates if they are of exactly the same type, and for each i, the i-th arc of r is attached to the same concept as the i-th arc of s. Duplicate relations often occur as the result of a join operation, as in Fig 2.8 we can delete relation

[STUDENT : "John"] \leftarrow (Agnt) \leftarrow [PLAY] and represented in Fig 2.9.

Figure 2.9 : The Graphs Obtained After Simplification.

2.2.5 Maximal Join

Maximal join($G_1:C_1, G_2:C_2, G_3$) is an important and useful operation defined on CG[JACKMAN and PAVELIN (1988)], which can be considered for the composition of CGs. It has been defined as a join of two graphs followed by a sequence of restrictions, joins and simplifications that explain in 2.2.4 Canonical Formations of Conceptual Graphs, so that as much matching and merging of the original graph as possible is performed.

The algorithm for maximal joining the graph G_1 and G_2 is the following steps.

- 1) List all concepts contained in G_1 and G_2 .
- 2) Search for pairs of concept C_1 and C_2 which can be element of the projection graph.
- 3) Generate lists of relation which are connect to C_1 and C_2 in the corresponding graph.
- 4) Generate the resulting G_3 which consists of the projection graph link to subgraph that connect with C_1 and C_2 in G_1 and G_2 .

Example 2.2 Given G_1 and G_2 are two CGs, as in below figures.

From the algorithm that described above, we have

Step 1 : G_1 has the concept [PERSON : John] and [CAT : Meaw]

G_2 has the concept [CAT : Meaw] and [MAT]

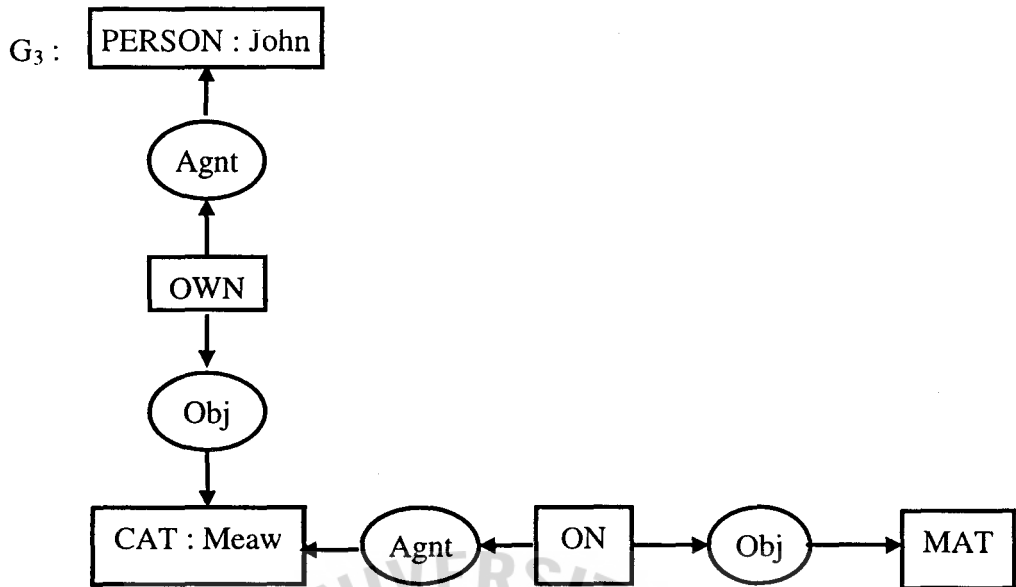

Step 2 : Search the pairs of concept :

$C_1 = [\text{CAT : Meaw}]$

$C_2 = [\text{CAT : Meaw}]$

Step 3 : Generate the lists of relation.

Step 4 : Generate the resulting graph G_3 :

2.2.6 Type Hierarchy

Type Hierarchy is a partial ordering on the set of types, indicated by the symbol \leq . If s and t are types and $t \leq s$, then t is said to be a **subtype** of s and s is said to be a **supertype** of t [Sait and Jame (1993)]. A type may have more than one supertype and more than one subtype.

If s , t , and u are types, with $t \leq s$ and $t \leq u$, then t is said to be a **common subtype** of s and u . Similarly, if $s \leq v$ and $u \leq v$ then v is a **common supertype** of s and u .

The **universal type**, indicated by T , is a supertype of all types. The **absurd type**, indicated by \perp , is a subtype of all types.

2.3 MAPPING SENTENCE TO CONCEPTUAL GRAPH WITH THE HELP OF PARSING TECHNIQUES

This requires a knowledge of the structure of the sentence, the roles of individual words and how the words modify each other. The process of determining the syntactical structure of a sentence is known as parsing.

Parsing is the process of analyzing a sentence by taking it apart word-by-word and determining its structure from its component parts and subparts. The structure of a sentence can be represented with a syntactic tree. The parsing process is basically the inverse of the sentence generation process since it involves finding a grammatical sentence structure from an input string. When given an input string, the lexical parts must first be identified by type, and then the role they play in a sentence must be determined. These parts can then be combined successively into larger units until a complete structure has been completed.

To determine the meaning of a word, a parser must have access to a lexicon. When the parser selects a word from the input stream it locates the word in the lexicon and obtains the word's possible function and other features, including semantic information. This information is then used in building a parse tree.

Example 2.3 Parse tree for a sentence “John plays tennis.” is given in Fig 2.10.

Figure 2.10 : A Parse Tree for “John plays tennis.”.

Once a parse tree is obtained, we apply the rule that is given in 2.2 to map the sentence into CG.

2.4 TEMPORAL KNOWLEDGE

An approach that can be used to model temporal information. CG can be extended to include the notion of time coordinate systems in the form of agent perspective and temporal localizations.

Any discourse contains sentences which result from speech acts performed by the narrator (speaker or writer) and received by another agent (hearer or reader). A conversation between agents is conducted in what we call a *conversational context*, the *place* and *time* where agents interact, as well as the *world knowledge* that is used.

This approach distinguishes two levels for representing the information contained in a discourse :

- a) Conceptual level which describes the relationships (temporal relations) associating temporal entities (objects, situations, localizations, perspectives).
- b) Linguistic level which contains the linguistic information needed for uttering the discourse sentences.

2.4.1 Time Intervals

All temporal structures are associated with a time interval [Bernard (1993)]. An absolute *time reference* (TR, called “time axis”) composed of a set of elements called “time points”. An elementary time interval is a continuous sub-set of TR.

The elementary time interval is specified by a list of parameters :

- a) Begin Time (BT)
- b) End Time (ET) (lower and upper bounds of the time interval on TR)
- c) Time Scale (TS) (unit used to measure the begin-time and end-time on TR)
- d) Duration Time (DT)
- e) Duration Scale (DS)

A *multiple time interval* is composed of a set of elementary time intervals, which may be contiguous or not.

2.4.2 Temporal Object

A temporal object is a concept that is characterized by a time interval such as “day”, “week”, “month” or “year” [Bernard (1993)]. A temporal object can be decomposed into other temporal object. For instance “day” can be decomposed into “morning”, “afternoon”, “evening” and “noon”.

We represent a temporal object with a rectangle. The rectangle represents the corresponding time interval. On the top of the rectangle we indicate BT and ET.

2.4.3 Temporal Relation

Temporal relations is the relation between two temporal objects. A fundamental set of thirteen temporal relations [Allen (1983)] are shown in the following:

- 1) BEFORE (X, Y) - time interval X is before Y, and they do not overlap.
- $ET(X) < BT(Y)$.

It can be seen in the following diagram :

- 2) DURING (X,Y) - time interval X is fully contained within Y, although they may coincide on their end points.
- $BT(X) > BT(Y)$.
- $ET(X) < ET(Y)$.

It can be seen in the following diagram :

3) OVERLAP (X,Y) - time interval X start before Y, and they overlap.

- $BT(X) < BT(Y)$.
- $ET(X) < ET(Y)$.
- $ET(X) - BT(Y) = OVERLAP(X,Y)$.

It can be seen in the following diagram :

4) EQUAL (X,Y) - time interval X is equal Y.

- $BT(X) = BT(Y)$.
- $ET(X) = ET(Y)$.

It can be seen in the following diagram :

5) MEET (X,Y)

- time interval X start before Y.
- $ET(X) = BT(Y)$.

It can be seen in the following diagram :

- 6) **START (X,Y)** - time interval X start at the same time of Y.
 - $BT(X) = BT(Y)$.

It can be seen in the following diagram :

- 7) **FINISH (X,Y)** - time interval X finish at the same time of Y.
 - $ET(X) = ET(Y)$.

It can be seen in the following diagram :

The remaining six temporal relations are inverse of FINISH, MEET, DURING, BEFORE, OVERLAP and START.

- 8) $FINISH^{-1}(Y,X)$ is the inverse of $FINISH(X,Y)$.
 9) $MEET^{-1}(Y,X)$ is the inverse of $MEET(X,Y)$.
 10) $DURING^{-1}(Y,X)$ is the inverse of $DURING(X,Y)$.
 11) $START^{-1}(Y,X)$ is the inverse of $START(X,Y)$.
 12) $OVERLAP^{-1}(Y,X)$ is the inverse of $OVERLAP(X,Y)$.
 13) $AFTER(Y,X)$ is the inverse of $BEFORE(X,Y)$.

A temporal relation associating two temporal objects is represented by a circle which is related to the two objects by arrow. The circle contains the temporal relation type (such as BEFORE, AFTER, DURING). We consider eight primitive relations called “AFTER”, “BEFORE”, “DURING”, “EQUAL”, “FINISH”, “OVERLAP”, “MEET” and “START” between two intervals.

Example 2.4 Temporal objects for a sentence “John played tennis on December 10,1997 from 9:00 to 9:30 after he had read a cartoon-book” are given in the Fig 2.11.

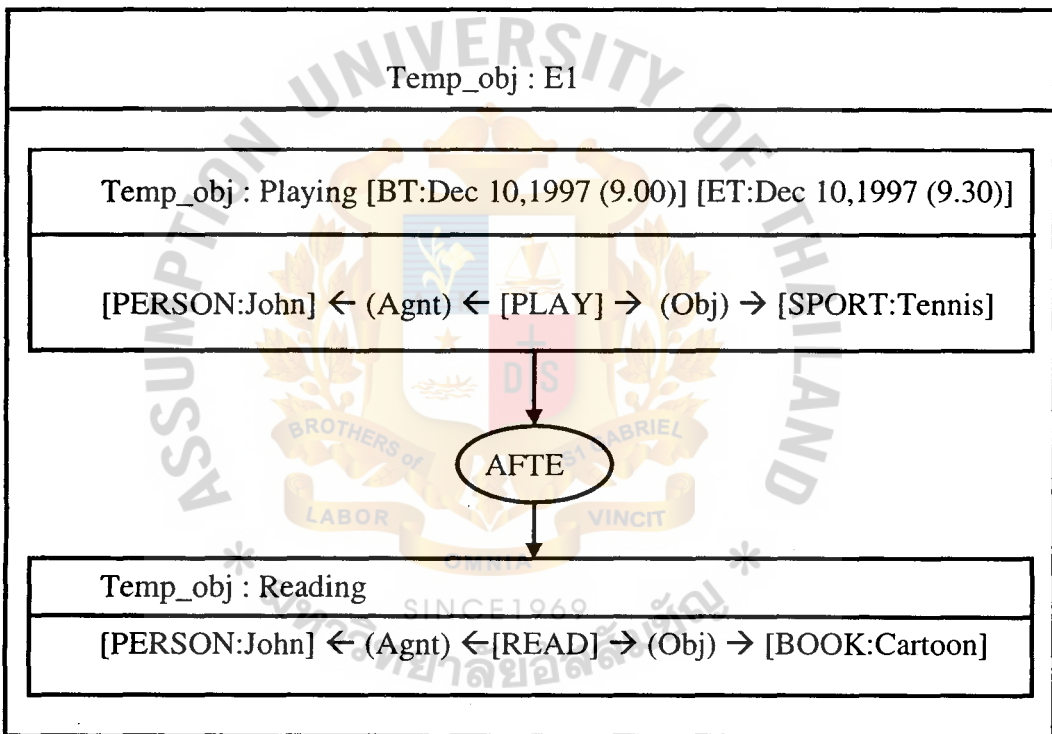

Figure 2.11 : Temporal Objects for “John played tennis on December 10,1997 from 9:00 to 9:30 after he had read a cartoon-book”.

2.4.4 Temporal Logic

All systems of temporal logic that we shall consider are extensions of minimal temporal logic and are obtained by impose further constraints on relation of temporal precedence [Turner (1984)]. The concept of “branching time” is obtained by impose two constraints R:

$$R1 : (\forall t \forall s \forall r) ((R(t, s) \& R(s, r)) \rightarrow R(t, r))$$

$$R2 : (\forall t \forall s \forall r) ((R(t, r) \& R(s, r)) \rightarrow R(t, s) \vee (t = s) \vee R(s, t))$$

Condition, R2, referred to as backwards linear.

$$R3 : (\forall t \forall s) ((R(s, t) \vee s = t) \rightarrow R(t, s))$$

Obviously, R3 is equivalent to the conjunction of R2, and forwards linear given as R4:

$$R4 : (\forall t \forall s \forall r) (R(r, t) \& R(r, s)) \rightarrow R(s, t) \vee (s = t) \vee R(t, s)$$

$$R5 : (\forall s) (\exists t) (R(t, s))$$

$$R6 : (\forall s) (\exists t) (R(s, t))$$

R5 guarantees that time has no beginning, and R6 that time has no end.

Each of temporal relations is represented by a predicate logic, and they are governed by a set of axioms of which the following are representative :

- 1) Before(A,B), Before(B,C) \rightarrow Before(A,C)
- 2) During(A,B), During(B,C) \rightarrow During(A,C)
- 3) Equal(A,B), Equal(B,C) \rightarrow Equal(A,C)
- 4) Finish(A,B), Finish(B,C) \rightarrow Finish(A,C)
- 5) Start(A,B), Start(B,C) \rightarrow Start(A,C)
- 6) After(A,B) \rightarrow Before(B,A)
- 7) Equal(A,B) \rightarrow Equal(B,A)
- 8) Finish(A,B) \rightarrow Finish(B,A)
- 9) Start(A,B) \rightarrow Start(B,A)
- 10) Before(A,C), During(B,C) \rightarrow Before(A,B)
- 11) Before(C,A), During(B,C) \rightarrow Before(B,A)

- 12) $\text{Before}(A,B), \text{Equal}(B,C) \rightarrow \text{Before}(A,C)$
- 13) $\text{Before}(A,B), \text{Equal}(A,C) \rightarrow \text{Before}(C,B)$
- 14) $\text{Before}(A,B), \text{Finish}(A,C) \rightarrow \text{Before}(C,B)$
- 15) $\text{Before}(B,C), \text{Meet}(A,B) \rightarrow \text{Before}(A,C)$
- 16) $\text{Before}(C,A), \text{Meet}(A,B) \rightarrow \text{Before}(C,B)$
- 17) $\text{Before}(A,B), \text{Overlap}(B,C) \rightarrow \text{Before}(A,C)$
- 18) $\text{Before}(A,B), \text{Overlap}(C,A) \rightarrow \text{Before}(C,B)$
- 19) $\text{Before}(A,B), \text{Start}(B,C) \rightarrow \text{Before}(A,C)$
- 20) $\text{During}(A,B), \text{Equal}(A,C) \rightarrow \text{During}(C,B)$
- 21) $\text{During}(A,B), \text{Equal}(B,C) \rightarrow \text{During}(A,C)$
- 22) $\text{During}(C,B), \text{Meet}(A,B) \rightarrow \text{Before}(A,C)$
- 23) $\text{During}(C,A), \text{Meet}(A,B) \rightarrow \text{Before}(C,B)$
- 24) $\text{Equal}(A,B), \text{Finish}(B,C) \rightarrow \text{Finish}(A,C)$
- 25) $\text{Equal}(A,C), \text{Meet}(A,B) \rightarrow \text{Meet}(C,B)$
- 26) $\text{Equal}(B,C), \text{Meet}(A,B) \rightarrow \text{Meet}(A,C)$
- 27) $\text{Equal}(A,B), \text{Overlap}(B,C) \rightarrow \text{Overlap}(A,C)$
- 28) $\text{Equal}(A,C), \text{Overlap}(B,C) \rightarrow \text{Overlap}(B,A)$
- 29) $\text{Equal}(A,B), \text{Start}(B,C) \rightarrow \text{Start}(A,C)$
- 30) $\text{Finish}(A,C), \text{Meet}(A,B) \rightarrow \text{Meet}(C,B)$
- 31) $\text{Finish}(A,B), \text{Start}(A,B) \rightarrow \text{Equal}(A,B)$
- 32) $\text{Meet}(A,B), \text{Start}(B,C) \rightarrow \text{Meet}(A,C)$
- 33) $\text{Meet}(A,B), \text{Overlap}(C,A) \rightarrow \text{Before}(C,B)$
- 34) $\text{Meet}(A,B), \text{Overlap}(B,C) \rightarrow \text{Before}(A,C)$

CHAPTER 3

IMPLEMENTATION ISSUES

This chapter presents the framework suggested by author. Mapping sentences to CGs, mapping sentences with temporal knowledge to CGs, mapping CGs to tables of relation database, mapping tables of relation database to predicates are discussed in Section 3.1 to 3.4. The development of temporal knowledge inference engine is given in Section 3.5.

3.1 MAPPING SENTENCE TO CONCEPTUAL GRAPH

The basic principle in mapping sentence to CG is that content words are map to concept nodes, and function words like prepositions and conjunctions are map to relation nodes. Following are some finer distinctions :

- a) Ordinary nouns, verbs, adverbs, and adjectives are mapped to concept node. For example [PERSON : John], [PLAY], and [TENNIS].
- b) Proper names map to the reference field of a concept whose type field specifies the type. For example [PERSON : John], [CITY : Bangkok], and [PLACE : ABAC].
- c) The symbol # with optional qualifiers is used in the reference field for contextually defined references. For example [PERSON : #John], [CITY : #Bangkok], and [PLACE : #ABAC].
- d) Plural nouns are represented by the plural reference {*} followed by an optional count.

- e) CR between two concept nodes is connected to concept nodes by the arrows.

Concept designs a type and a reference, which is either a *specified individual* or an *unspecified individual* or generic of the type. For example [PERSON : “John”] is specified individual, [BUS : *] or [BUS] is unspecified individual.

Example 3.1 Mapping the sentence “John plays tennis.” to CG.

1. John is noun, and is a name of person, thus we the concept node PERSON and specify by John. It is [PERSON : John].
2. Play is a verb, it is the concept node [PLAY].
3. Tennis is a noun, it is the concept node [TENNIS].
4. CR PLAY to PERSON with the relation agent, for abbreviate Agnt.

5. CR PLAY to TENNIS with the relation object, for abbreviate Obj.

Combining 4 and 5 we get the complete CG for “John plays tennis.”.

Figure 3.1 : CG for “John plays tennis.”.

3.2 MAPPING SENTENCE WITH TEMPORAL KNOWLEDGE TO CONCEPTUAL GRAPH

The mapping a sentence with temporal knowledge to CG can be done through following steps :

- 1) Decompose the sentence into subclauses.
- 2) Change each subclauses to CG and map to temporal object.
- 3) Relate each temporal objects with the temporal relation type (such as BEFORE, AFTER, DURING).

In order to explain the mapping from temporal knowledge to CG, the example are given below :

Example 3.2 The sentence “On July 15,1998, John started sleeping at 4pm during the time Mary watched TV from 3pm to 5pm, after that they had dinner together.”.

Step 1 : The sentence can be decomposed into :

- Subclause 1 “John started sleeping.”.
- Subclause 2 “Mary watched TV.”.
- Subclause 3 “John and Mary had dinner.”.

Step 2 : - Change “Subclause 1” to CG and map to temporal object “Sleeping”,

- change “Subclause 2” to CG and map to temporal object “Watching”, and

- change “Subclause 3” to CG and map to temporal object “Having_dinner”.

Step 3 : Relate temporal object “Sleeping” and “Watching” with temporal relation DURING. Temporal object “Sleeping” represent BT by [BT : July 15,1998 (16.00)]. Temporal object “Watching” represent BT by [BT : July 15,1998 (15.00)] and ET by [ET : July 15,1998 (17.00)].

Step 4 : Relate temporal object “Watching” and “Having_dinner” with temporal relation BEFORE.

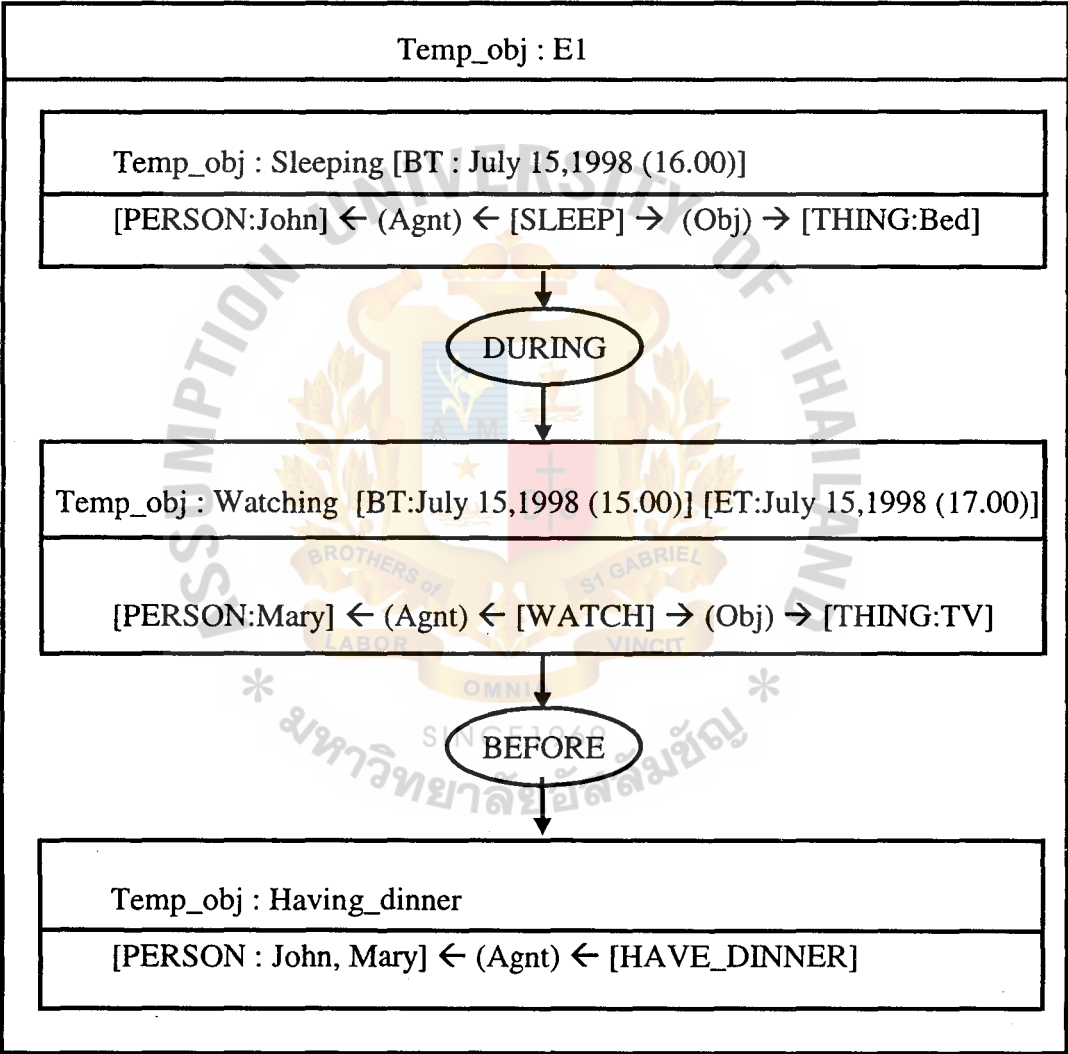

Figure 3.2 : CG of “On July 15,1998, John started sleeping at 4pm during the time Mary watched TV from 3pm to 5pm, after that they had dinner together.”.

3.3 MAPPING CONCEPTUAL GRAPH TO TABLES OF RELATION DATABASE

All graph-storing tables in our system can be shown in the following :

1) The conceptual table, the domains common to all uses are :

- | | |
|--------------|----------------------------------|
| - TYPE | The concept from and to position |
| - INDIVIDUAL | The reference of concept |

2) The action table, the common domains are :

- | | |
|----------|---|
| - FROM | The reference of the concept in the from position |
| - ACTION | The concept refer to action name |
| - TO | The reference of the concept in the to position |
| - EVENT | The event name |

3) The temporal relation table, the common domains are :

- | | |
|-----------|---|
| - TYPE | The temporal relation : after, before, and during |
| - EVENT_1 | The event name |
| - EVENT_2 | The event name |

4) The time table, the common domains are :

- | | |
|---------|------------------------|
| - EVENT | The event name |
| - BT | Begin time of event |
| - ET | End time of event |
| - DT | Duration Time of event |

When we mention the FROM and TO positions, these refer to the concepts attached to a relation; the FROM position is occupied by a concept which points to the relation, and the TO position is occupied by a concept which the relation points to.

Example 3.3 Consider the CG given in Fig 3.2 that presented “On July 15,1998, John started sleeping at 4pm during the time Mary watched TV from 3pm to 5pm, after that they had dinner together.” can be mapped to RDB as Fig 3.3.

CONCEPTUAL TABLE :

| TYPE | INDIVIDUAL |
|--------|------------|
| Person | John |
| Person | Mary |
| Thing | Bed |
| Thing | TV |

ACTION TABLE:

| FROM | ACTION | TO | EVENT |
|------------|-------------|-----|---------------|
| John | Sleep | Bed | Sleeping |
| Mary | Watch | TV | Watching |
| John, Mary | Have_dinner | - | Having_dinner |

TEMPORAL RELATION TABLE :

| TYPE | EVENT_1 | EVENT_2 |
|--------|----------|---------------|
| During | Sleeping | Watching |
| Before | Watching | Having_dinner |

TIME TABLE :

| EVENT | BT | ET | DT |
|----------|----------------------|----------------------|----|
| Watching | July 15,1998 (15.00) | July 15,1998 (17.00) | - |
| Sleeping | July 15,1998 (16.00) | - | - |

Figure 3.3 : RDB for “On July 15,1998, John started sleeping at 4pm during the time Mary watched TV from 3pm to 5pm, after that they had dinner together.”

Example 3.4 Mapping the CG given in Fig 2.11 that represented “John played tennis on December 10,1997 from 9:00 to 9:30 after he had read a cartoon-book” to RDB as Fig 3.4.

CONCEPTUAL TABLE :

| TYPE | INDIVIDUAL |
|--------|--------------|
| Person | John |
| Sport | Tennis |
| Book | Cartoon-Book |

ACTION TABLE:

| FROM | ACTION | TO | EVENT |
|------|--------|--------------|---------|
| John | Play | Tennis | Playing |
| John | Read | Cartoon-Book | Reading |

TEMPORAL RELATION TABLE:

| TYPE | EVENT_1 | EVENT_2 |
|-------|---------|---------|
| After | Playing | Reading |

TIME TABLE :

| EVENT | BT | ET | DT |
|---------|--------------------|--------------------|----|
| Playing | Dec 10,1997 (9.00) | Dec 10,1997 (9.30) | - |

Figure 3.4 : RDB for “John played tennis on December 10,1997 from 9:00 to 9:30 after he had read a cartoon-book”.

3.4 MAPPING TABLES OF RELATION DATABASE TO PREDICATES

From tables of relation database that explain in 3.4 can map to following predicates:

- 1) The conceptual table is mapping to the predicate form as
“concept(TYPE, INDIVIDUAL)”
- 2) The action table is mapping to the predicate form as
“action(FROM, ACTION, TO, EVENT)”
- 3) The temporal relation table is mapping to the predicate form as
“TYPE(EVENT_1,EVENT_2)”
- 4) The time table is mapping to the predicate form as
“event(EVENT, BT, ET, DT)”

Example 3.5 Mapping RDB given in Fig 3.3 to predicates as follow:

concept(person, john)
concept(person, mary)
concept(thing, bed)
concept(thing, tv)
action(john, sleep, bed, sleeping)
action(mary, watch, tv, watching)
action(john, have_dinner, -, having_dinner)
action(mary, have_dinner, -, having_dinner)
during(sleeping, watching)
before(watching, having_dinner)
event(watching,bt(1998,07,15,15,00), et(1998,07,15,17,00), DT)
event(sleeping,bt(1998,07,15,16,00), ET, DT)

Example 3.6 Mapping RDB given in Fig 3.4 to predicates as follow:

concept(person, john)

concept(sport, tennis)

concept(book, cartoon)

action(john, play, tennis, playing)

action(john, read, cartoon, reading)

after(playing, reading)

event(playing, bt(1997,12,10,09,00), et(1997,12,10,09,30), DT)

3.5 TEMPORAL KNOWLEDGE INFERENCE ENGINE

At a general level, the sequence of events take place when new information is added to the application. This makes the temporal knowledge changing. The result of an evaluation of either an adding or query is known or unknown. If any assertion contains unknown information then this is request to add more necessary new information.

When new information are added to the application, new temporal model that follow from the new information are not generated until query time.

3.5.1 Algorithm for Finding Time

Prototype : $time(EvI)$

- 1) If we have the knowledge base as : “event(Ev1, bt(Year, Month, Day, Hour, Minute), et(Year,Month,Day,Hour,Minute), dt(Year,Month,Day,Hour,Minute))”.

If we know only two arguments, a multi-way reasoning allows us to infer the another. For example

- a) BT and ET are known, DT can be computed as : $DT = ET - BT$.

It can be represented in the pseudocode rule as :

$event(Ev1, bt(...), et(...), D) \rightarrow D \text{ is } et(...) - bt(...)$

- b) BT and DT are known, ET can be computed as : $ET = BT + DT$.

It can be represented in the pseudocode rule as :

$\text{event}(\text{Ev1}, \text{bt}(\dots), \text{E}, \text{dt}(\dots)) \rightarrow \text{E is } \text{bt}(\dots) + \text{dt}(\dots)$

It can be written in the following prolog program :-

```
time(Ev1) :- event(Ev1, bt(Yr1, Mo1, Da1, Hr1, Mn1), et(Yr, Mo, Da, Hr, Mn),
                  dt(Yr2, Mo2, Da2, Hr2, Mn2)),
              nonvar(Yr1), nonvar(Yr2), var(Yr),
              Mn is Mn1 + Mn2, Hr is Hr1 + Hr2, Da is Da1 + Da2,
              Mo is Mo1 + Mo2, Yr is Yr1 + Yr2,
              check(Yr, Mo, Da, Hr, Mn),
              display("et(Yr, Mo, Da, Hr, Mn)").
```

Predicate "check" checks the legality of time, for example the value of Hr should be in the range of 0 to 24.

- c) ET and DT are known, BT can be computed as : $\text{BT} = \text{ET} - \text{DT}$.

It can be represented in the pseudocode rule as :

$\text{event}(\text{Ev1}, \text{B}, \text{et}(\dots), \text{dt}(\dots)) \rightarrow \text{B is } \text{et}(\dots) - \text{dt}(\dots)$

- d) If all BT, ET, DT are known, it is necessary to check whether these values are compatible, it means that $\text{ET} = \text{BT} + \text{DT}$ should be satisfied.

- e) For an event, the ending time should be larger than the begin time, therefore $\text{event}(\text{Ev1}, \text{bt}(\dots), \text{E}, \text{D}) \rightarrow \text{E} \geq \text{bt}(\dots)$

This rule can be used to infer the ET of an event when it BT is known.

- f) For an event, the begin time should be smaller than the end time, therefore $\text{event}(\text{Ev1}, \text{B}, \text{et}(\dots), \text{D}) \rightarrow \text{B} \leq \text{et}(\dots)$

This rule can be used to infer the BT of an event when it ET is known.

All of these rules can be applied and resolved the conflicts to find a best reasonable interval for a time variable. For example if we know that

$\text{ET} > (1990, 10, 20, 12, 00)$

$\text{ET} > (1992, 1, 12, 15, 30)$

$ET > (1989,5,20,01,00)$

$ET < (1998,10,20,12,00)$ and

$ET < (1998,5,10,12,00)$.

Then the suitable range for ET is from (1992,1,12,15,30) to (1998,5,10,12,00).

Based on (a), (b), and (c), the time of event is known explicitly, if we know any two variables of BT, ET or DT.

- 2) Temporal knowledge of an event can be derived from temporal knowledge of other events and temporal relationships, as given in table 3.1. In this table a marked data is a known data.

| Relation | Event 1 | | Event 2 | | Inference Rule |
|-----------|---------|----|---------|----|---|
| | BT | ET | BT | ET | |
| 1. BEFORE | ✓ | | ✓ | | $BT1 < \underline{ET1} < BT2$ |
| | ✓ | | | ✓ | $BT1 < \underline{ET1} < \underline{BT2} < ET2$ |
| | ✓ | | | | $BT1 < \underline{ET1} < \underline{BT2} < \underline{ET2}$ |
| | | ✓ | | ✓ | $ET1 < \underline{BT2} < ET2$ |
| | | ✓ | | | $ET1 < \underline{BT2} < \underline{ET2}$ |
| | | | ✓ | | $\underline{BT1} < \underline{ET1} < BT2$ |
| | | | | ✓ | $\underline{BT1} < \underline{ET1} < \underline{BT2} < ET2$ |
| | | | | | |
| 2. DURING | ✓ | | | | $\underline{BT2} < BT1$ |
| | | ✓ | | | $ET1 < \underline{ET2}$ |
| | | | ✓ | | $BT2 < \underline{BT1}$ |
| | | | | ✓ | $\underline{ET1} < ET2$ |
| | ✓ | | | ✓ | $BT1 < \underline{ET1} < ET2$ |
| | | ✓ | ✓ | | $BT2 < \underline{BT1} < ET1$ |

Table 3.1 : Inference Rules. The underlined variables are derived variables.
(Continued on the next page.)

| Relation | Event 1 | | Event 2 | | Inference Rule |
|------------|---------|----|---------|----|---|
| | BT | ET | BT | ET | |
| 3. EQUAL | ✓ | | | | $BT1 = \underline{BT2}$ |
| | | | ✓ | | $\underline{BT1} = BT2$ |
| | | ✓ | | | $ET1 = \underline{ET2}$ |
| | | | | ✓ | $\underline{ET1} = ET2$ |
| 4. FINISH | | ✓ | | | $ET1 = \underline{ET2}$ |
| | | | | ✓ | $\underline{ET1} = ET2$ |
| 5. MEET | | ✓ | | | $ET1 = \underline{BT2}$ |
| | | | ✓ | | $\underline{ET1} = BT2$ |
| 6. OVERLAP | ✓ | | | | $BT1 < \underline{BT2}$ |
| | | ✓ | | | $\underline{BT2} < ET1 < \underline{ET2}$ |
| | | | ✓ | | $\underline{BT1} < BT2 < \underline{ET1}$ |
| | | | | ✓ | $\underline{ET1} < ET2$ |
| | ✓ | ✓ | | | $BT1 < \underline{BT2} < ET1$ |
| | | | ✓ | ✓ | $BT2 < \underline{ET1} < ET2$ |
| 7. START | ✓ | | | | $BT1 = \underline{BT2}$ |
| | | | ✓ | | $\underline{BT1} = BT2$ |

Table 3.1 (Continued).

3.5.2 Algorithm for Finding Before Relation

Prototype : $before(Ev1, Ev2)$. This predicate is true if event 1 occurred before event 2. Before predicate can be defined on the comparison between ET of one event with the BT of other event as :

If $ET1 < BT2 \rightarrow Before(Ev1, Ev2)$

The before relation is a transitive relation, therefore

$Before(A, B), Before(B, C) \rightarrow Before(A, C)$

Other approaches, the relation before can be derive from other relations

$After(A, B) \rightarrow Before(B, A)$

$Before(A, C), During(B, C) \rightarrow Before(A, B)$

$\text{Before}(C,A), \text{During}(B,C) \rightarrow \text{Before}(B,A)$
 $\text{Before}(A,B), \text{Equal}(B,C) \rightarrow \text{Before}(A,C)$
 $\text{Before}(A,B), \text{Equal}(A,C) \rightarrow \text{Before}(C,B)$
 $\text{Before}(A,B), \text{Finish}(A,C) \rightarrow \text{Before}(C,B)$
 $\text{Before}(B,C), \text{Meet}(A,B) \rightarrow \text{Before}(A,C)$
 $\text{Before}(C,A), \text{Meet}(A,B) \rightarrow \text{Before}(C,B)$

$\text{Before}(A,B), \text{Overlap}(B,C) \rightarrow \text{Before}(A,C)$
 $\text{Before}(A,B), \text{Overlap}(C,A) \rightarrow \text{Before}(C,B)$
 $\text{Before}(A,B), \text{Start}(B,C) \rightarrow \text{Before}(A,C)$
 $\text{During}(C,B), \text{Meet}(A,B) \rightarrow \text{Before}(A,C)$
 $\text{During}(C,A), \text{Meet}(A,B) \rightarrow \text{Before}(C,B)$
 $\text{Meet}(A,B), \text{Overlap}(C,A) \rightarrow \text{Before}(C,B)$
 $\text{Meet}(A,B), \text{Overlap}(B,C) \rightarrow \text{Before}(A,C)$

3.5.3 Algorithm for Finding During Relation

Prototype : *during*(*Ev1*,*Ev2*). This predicate is true if event 1 occurred during the time of event 2. The during relation can be derived on the comparison of BT and ET of two events, or form the transitive property of during as :

If $BT_1 > BT_2$ and $ET_1 < ET_2 \rightarrow \text{During}(\text{Ev1}, \text{Ev2})$
 $\text{During}(A,B), \text{During}(B,C) \rightarrow \text{During}(A,C)$
 $\text{During}(A,B), \text{Equal}(A,C) \rightarrow \text{During}(C,B)$
 $\text{During}(A,B), \text{Equal}(B,C) \rightarrow \text{During}(A,C)$

3.5.4 Algorithm for Finding Equal Relation

Prototype : *equal*(*Ev1*,*Ev2*). This predicate is true if event 1 occurred at the same time of event 2. The equal relation can be derived on the comparison of BT and ET of two events, or form the transitive property of equal, or backward property as :

If $BT_1 = BT_2$ and $ET_1 = ET_2 \rightarrow \text{Equal}(\text{Ev1}, \text{Ev2})$
 $\text{Equal}(A,B), \text{Equal}(B,C) \rightarrow \text{Equal}(A,C)$
 $\text{Equal}(A,B) \rightarrow \text{Equal}(B,A)$

$$\text{Finish}(A,B), \text{Start}(A,B) \rightarrow \text{Equal}(A,B)$$

3.5.5 Algorithm for Finding Finish Relation

Prototype : *finish(Ev1,Ev2)*. This predicate is true if event 1 finished at the same time of event 2. The finish relation can be derived on the comparison of BT and ET of two events, or from the transitive property of finish, or backward property as :

$$\text{If } ET1 = ET2 \rightarrow \text{Finish}(Ev1,Ev2)$$

$$\text{Finish}(A,B), \text{Finish}(B,C) \rightarrow \text{Finish}(A,C)$$

$$\text{Finish}(A,B) \rightarrow \text{Finish}(B,A)$$

$$\text{Equal}(A,B), \text{Finish}(B,C) \rightarrow \text{Finish}(A,C)$$

3.5.6 Algorithm for Finding Meet Relation

Prototype : *meet(Ev1,Ev2)*. This predicate is true if ending time of event 1 and beginning time of event 2 are equal. The meet relation can be derived on the comparison of BT and ET of two events as :

$$\text{If } ET1 = BT2 \rightarrow \text{Meet}(Ev1,Ev2)$$

$$\text{Equal}(A,C), \text{Meet}(A,B) \rightarrow \text{Meet}(C,B)$$

$$\text{Equal}(B,C), \text{Meet}(A,B) \rightarrow \text{Meet}(A,C)$$

$$\text{Finish}(A,C), \text{Meet}(A,B) \rightarrow \text{Meet}(C,B)$$

$$\text{Meet}(A,B), \text{Start}(B,C) \rightarrow \text{Meet}(A,C)$$

3.5.7 Algorithm for Finding Overlap Relation

Prototype : *overlap(Ev1,Ev2)*. This predicate is true if event 1 occurred before event 2 and they overlap. The overlap relation can be derived on the comparison of BT and ET of two events as :

$$\text{If } BT1 < BT2 \text{ and } BT2 < ET1 < ET2 \rightarrow \text{Overlap}(Ev1,Ev2)$$

$$\text{Equal}(A,B), \text{Overlap}(B,C) \rightarrow \text{Overlap}(A,C)$$

$$\text{Equal}(A,C), \text{Overlap}(B,C) \rightarrow \text{Overlap}(B,A)$$

3.5.8 Algorithm for Finding Start Relation

Prototype : $start(Ev1, Ev2)$. This predicate is true if event 1 started at the same time of event 2. The start relation can be derived on the comparison of BT and ET of two events, or from the transitive property of start, or backward property as :

If $BT1 = BT2 \rightarrow Start(Ev1, Ev2)$

$Start(A, B), Start(B, C) \rightarrow Start(A, C)$

$Start(A, B) \rightarrow Start(B, A)$

$Equal(A, B), Start(B, C) \rightarrow Start(A, C)$

3.5.9 Algorithm for Finding the Topology Order

Prototype : $topology(Order)$. The topology order of events can be obtained through the following step :

- 1) Find all before relations ($before(Ev1, Ev2)$) and store them.
- 2) Count the member of incoming edges for each event. The number of incoming edges is the number of events occurring before the specified event.
- 3) Find event whose the number of incoming edge equal to 0 and put it to order.
- 4) Put the first list to the result.
- 5) Find the relation $before(X, Y)$ and put Y to the order of result.
- 6) Repeat step (5) until no relation that match $before(X, Y)$.
- 7) Repeat (4) to (6) with the next list until empty list.

CHAPTER 4

TEMPORAL KNOWLEDGE PROGRAM

This chapter presents the features of the temporal knowledge process program that has been developed. The process how to input, how to infer and how to query the temporal knowledge will be given in detail, through some examples.

4.1 TEMPORAL KNOWLEDGE PROCESS

Temporal knowledge process have the following steps :

1. Input knowledge into CG.
2. Find topological order, temporal relation and time by Prolog program.
3. Display temporal relation and CG by Visual Basic program.

4.2 HOW TO INPUT THE KNOWLEDGE

We can input the knowledge into the application 2 ways :

4.2.1 Input Obtained from Temporal Knowledge Program (Written in Visual Basic)

The menu of the CG program in Visual Basic program is given in Fig 4.1.

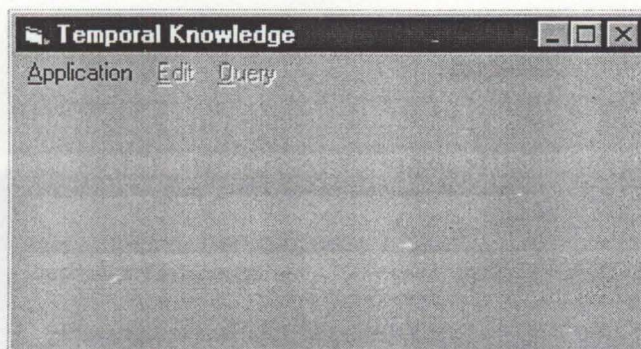

Figure 4.1 : Temporal Knowledge's Menu.

The functions of menu items are explained as follow :

a) Application Menu

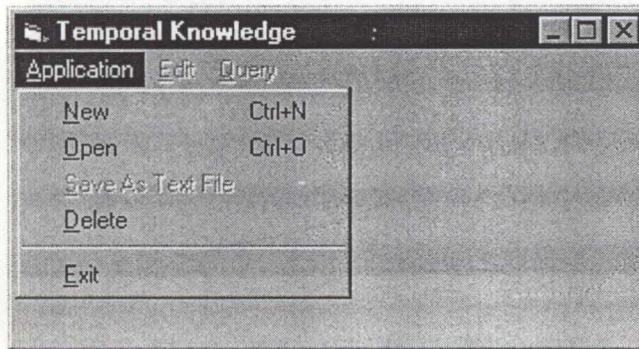

Figure 4.2 : Application Menu.

- New : create new application.
- Open : open the existing application. The existing application will be displayed as in Fig 4.3.
- Save As Text File : save application in text file format.
- Delete : delete the application.
- Exit : exit the program.

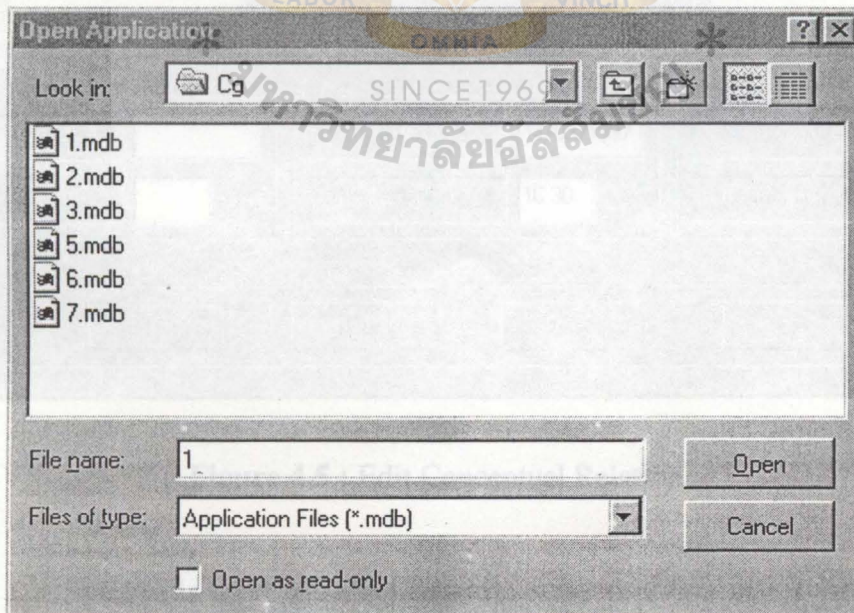

Figure 4.3 : Open Application Dialog Box.

b) Edit Menu

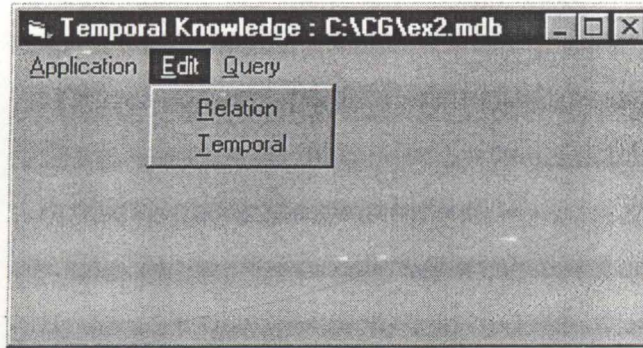

Figure 4.4 : Edit Menu.

- Edit Conceptual Relation

When you selected this command, it will show in Fig 4.5.

The screenshot shows a dialog box titled 'Relation : C:\CG\ex2.mdb'. It contains several input fields and buttons. On the left, there are fields for 'Concept Type 1' (containing 'person') and 'Individual Name 1' (containing 'john'). In the center, there are fields for 'Event Name' (containing 'shopping') and 'Relation' (containing 'shop'). On the right, there are fields for 'Concept Type 2' (containing 'place') and 'Individual Name 2' (containing 'supermarket'). Below these fields is a navigation bar with buttons for 'Previous', 'First', 'OMNIA', 'Last', and 'Next'. At the bottom, there are three groups of date and time fields: 'Begin' (Date [dd/mm/yyyy] and Time [hh.mm]), 'End' (Date [dd/mm/yyyy] containing '14/03/1997' and Time [hh.mm] containing '16.30'), and 'Duration' (Date [dd/mm/yyyy] containing '00/00/0000' and Time [hh.mm] containing '03.00'). At the very bottom, there are four buttons: 'Add New', 'Edit', 'Delete', and 'Exit'.

Figure 4.5 : Edit Conceptual Relation.

Figure 4.6 : Add New Relation Form.

Mouse is used to select relation. After that you select the following command button.

- Add New Button : for adding the new relation to the application. After that, it will show the blank form for input the event_name, concept_type_1, individual_name_1, relation, concept_type_2, individual_name_2, begin_date, begin_time, end_date, end_time, duration_date and duration_time as shown in Fig 4.6.
- Edit Button : for modify any attributes about concept such as concept type, relation, and individual name. The old information is displayed, and we can correct it.
- Delete Button : for deleting the relation from application. It will show detail about concept type, relation, and individual name.
- Exit Button : for leaving the relation submenu, and go back to the main menu.

The screenshot shows a Windows-style dialog box titled "Add New Relation". It features a close button (X) in the top right corner. The main area contains several text input fields arranged in a grid. The first row includes "Concept Type 1", "Event Name", and "Concept Type 2". The second row includes "Individual Name 1", "Relation", and "Individual Name 2". Below these are three sections for temporal data: "Begin", "End", and "Duration". Each of these sections has two sub-inputs: "Date [dd/mm/yyyy]" and "Time [hh.mm]". At the bottom of the dialog, there are two buttons: "OK" and "Cancel".

Figure 4.6 : Add New Relation Form.

- Temporal Relation

When this submenu is selected, it will show the temporal relationship between Conceptual relations, for example as in Fig 4.7.

Figure 4.7 : Temporal Relation Form.

You click mouse to data control for select temporal relation. After that you select the following command button.

- Add New Button : append new temporal relation.
- Edit Button : edit temporal relation.
- Delete Button : delete temporal relation.
- Exit Button : stop doing the temporal relation command, and go back to main menu.

4.2.2 Input from Text File

The temporal knowledge can be specified in the following forms.

- a) event(Event_Name, bt(Year, Month, Day, Hour, Minute), et(Year, Month, Day, Hour, Minute), dt(Year, Month, Day, Hour, Minute)).

The explicit value with specified explicitly. The unknown value will be given as a variable. For example if we know BT and DT of “have_lunch”, it can be written as

“event(have_lunch, bt(1998,5,20,12,00), A, dt(0,0,0,1,30))”, where A is a variable of ET, this means that ET is unknown.

- b) after_of(Event_1, Event_2). : “Event_1” occurred after “Event_2”.
- c) before_of(Event_1, Event_2). : “Event_1” happened before “Event_2”.
- d) during_of(Event_1, Event_2). : “Event_1” happened during the time of “Event_2”.
- e) equal_of(Event_1, Event_2). : time of “Event_1” equal the time of “Event_2”.
- f) finish_of(Event_1, Event_2). : “Event_1” finished at the same time of “Event_2”.
- g) meet_of(Event_1, Event_2). : “Event_2” meet “Event_1”.
- h) overlap_of(Event_1, Event_2). : “Event_1” overlap with “Event_2”.
- i) start_of(Event_1, Event_2). : “Event_1” start at the same time of “Event_2”.

Example 4.1 Suppose that we have the following story :

“On March 14,1997, Mary went swimming in the early morning at YMCA club and she finished swimming at 8.00. After that she had breakfast at the club. While she were having breakfast, she met her friend, John. They had a talk about business until 9.00. After that Mary went home. On the way to home, she filled gas at the petrol station. She arrived home at 10.00.

It can be shown in the following diagram :

We can translate to table as :

CONCEPTUAL TABLE :

| TYPE | INDIVIDUAL |
|--------|----------------|
| Person | John |
| Person | Mary |
| Place | Petrol Station |
| Place | YMCA |
| Place | Home |

ACTION TABLE :

| FROM | ACTION | TO | EVENT |
|------|----------------|----------------|------------|
| Mary | Swim | YMCA | Swimming |
| Mary | Have_breakfast | YMCA. | Breakfast |
| Mary | Meet_friend | John | Meeting |
| Mary | Talk_business | John | Talking |
| Mary | Go | Home | Going_home |
| Mary | Fill_gas | Petrol_station | Filling |

TEMPORAL RELATION TABLE:

| TYPE | EVENT_1 | EVENT_2 |
|--------|-----------|------------|
| Meet | Swimming | Breakfast |
| Finish | Breakfast | Meeting |
| Finish | Breakfast | Talking |
| During | Talking | Breakfast |
| During | Meeting | Breakfast |
| Meet | Breakfast | Going_home |
| During | Filling | Going_home |

TIME TABLE :

| EVENT | BT | ET | DT |
|------------|----|---------------------|----|
| Swimming | - | Mar 14,1997 (08.00) | - |
| Breakfast | - | Mar 14,1997 (09.00) | - |
| Meeting | - | Mar 14,1997 (09.00) | - |
| Talking | - | Mar 14,1997 (09.00) | - |
| Going_home | - | Mar 14,1997 (10.00) | - |

Finally, it can be converted to the following facts :

event(swimming, A, et(1997,03,14,08,00), C).

event(breakfast, A, et(1997,03,14,09,00), C).

event(meeting, A, et(1997,03,14,09,00), C).

event(talking, A, et(1997,03,14,09,00), C).

event(going_home, A, et(1997,03,14,10,00), C).

event(filling, A, B, C).

meet_of(swimming, breakfast).

finish_of(breakfast, meeting).

finish_of(breakfast, talking).

during_of(talking, breakfast).

during_of(meeting, breakfast).

meet_of(breakfast, going_home).

during_of(filling, going_home).
 concept(person, mary).
 concept(place, ymca).
 concept(person, john).
 concept(place, home).
 concept(place, petrol_station).
 action([mary],[swim],[ymca],swimming).
 action([mary],[have_breakfast],[ymca],breakfast).
 action([mary],[meet_friend],[john],meeting).
 action([mary],[talk_business],[john],talking).
 action([mary],[go],[home],going_home).
 action([mary],[fill_gas],[petrol_station],filling).

4.3 HOW TO QUERY THE TEMPORAL KNOWLEDGE

4.3.1 Query from Prolog Program

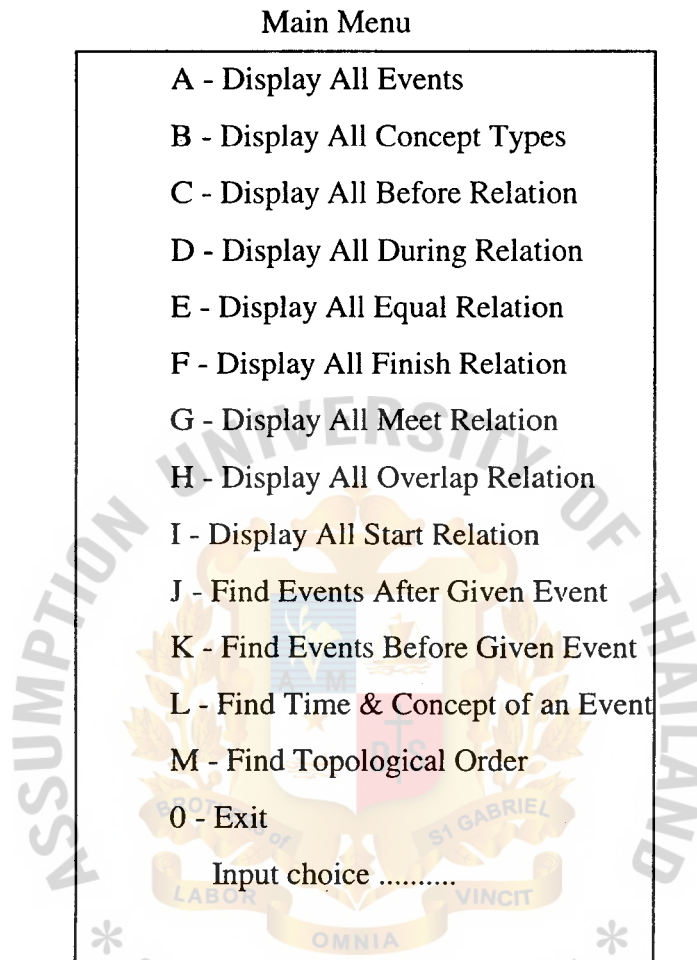

Figure 4.8 : Prolog Program's Menu.

For the temporal knowledge given in Example 4.1, we can have the following queries:

A) Display all Events

Event = [filling, going_home, talking, meeting, breakfast, swimming]

B) Display all Concept Types.

Concept Type = [person, place]

place : [petrol_station, home, ymca]

person : [john, mary]

C) Display All Before Relations

[before(breakfast, going_home), before(swimming, breakfast),
before(swimming, going_home), before(meeting, going_home),
before(talking, going_home), before(breakfast, filling),
before(swimming, filling), before(meeting, filling), before(talking, filling),
before(swimming, meeting), before(swimming, talking)]

D) Display All During Relations

[during(filling, going_home),
during(meeting, breakfast),
during(talking, breakfast)]

E) Display All Equal Relations

[]

F) Display All Finish Relations

[finish(talking, breakfast), finish(meeting, breakfast),
finish(breakfast, talking), finish(breakfast, meeting)]

G) Display All Meet Relations

[meet(talking, going_home), meet(meeting, going_home),
meet(breakfast, going_home), meet(swimming, breakfast)]

H) Display All Overlap Relations

[]

I) Display All Start Relations

[]

J) Find Events After a Given Event

Input event name : meeting.

Event after event "meeting" is [going_home, filling]

K) Find Events before a given Event

Input event name : meeting.

Event before meeting is [swimming]

L) Find Time & Concept of Event

Input event name : meeting.

[mary] [meet_friend] [john]

Begin time before ==> 1997/3/14 9:0

after ==> 1997/3/14 8:0

End time equal ==> 1997/3/14 9:0

M) Find Topological Orders

Topological = [[swimming,breakfast,going_home],

[swimming,breakfast,filling],

[swimming,meeting,going_home],

[swimming,meeting,filling],

[swimming,talking,going_home],

[swimming,talking,filling]]

4.3.2 Query from Visual Basic Program

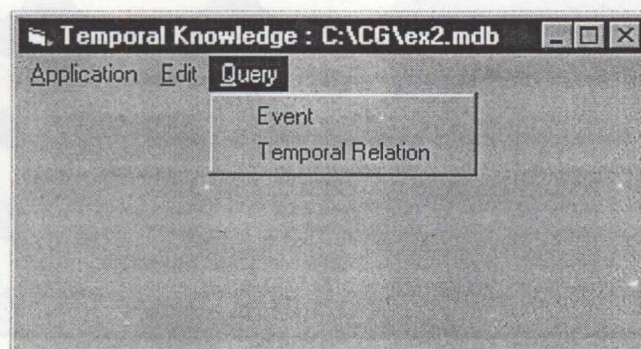

Figure 4.9 : Query Menu.

a) Event submenu

When you select this menu item, it will show the form as in Fig 4.10.

Query : Concept of the event

Query
Select event :

Agent

Relation

Object

Exit

Figure 4.10 : Query Event Item.

b) Temporal Relation

From topology graph, you can find the CG of events by clicking at its node.

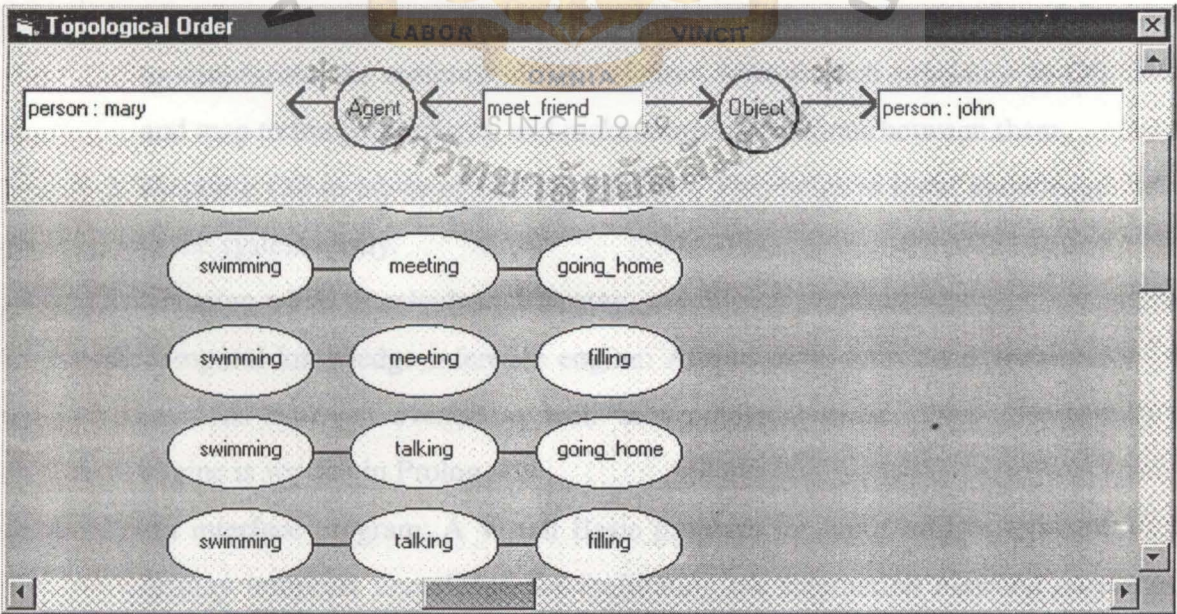

Figure 4.11 : Topology Graph.

CHAPTER 5

CONCLUSION AND RECOMMENDATION

5.1 CONCLUSION

The following topics on temporal knowledge based on CG have been studied:

1. Mapping the sentence to CG: It composes of rules, type of references, mapping aspects, hierarchical links, canonical formation, maximal join and type hierarchy.
2. Temporal knowledge such as time intervals, temporal objects, temporal relations, and temporal logic: Temporal relation is relation between two temporal objects. Each temporal object can be associated with a time interval.

After that the following topics have been proposed and developed:

1. Mapping the sentence with the temporal knowledge to CG: It shows how to decompose the sentence into subclauses, change each subclause to CG and map to temporal object, and make temporal relations between them.
2. Mapping CG to tables of relation database: This helps to input knowledge to the system easily.
3. Mapping tables to calculus predicates.
4. Temporal knowledge inference engine: Allows us to infer time, temporal relations between events, as well as topological order. This inference engine is written in Prolog.
5. An interface program: A Visual Basic program for input, edit, delete and display temporal knowledge for facilitating the interaction between user and system. This program also displays temporal relations and CGs in graphical mode.

A mapping from sentence to calculus predicate has been studied, the process includes three steps, mapping a sentence to CG, then from CG to tables and finally to predicates. Which the final form, it allows us to make the inference and easily to check the consistency of the system as well as to guarantee constraints, which are set by user.

5.2 RECOMMENDATION

In addition, the demonstration system of temporal knowledge has been developed. It is useful for querying the temporal knowledge such as time of event, temporal relation between events and the topological orders between events. The approaches followed in this study could be adapted to construct a larger temporal knowledge system. Future enhancement to the temporal knowledge system can be developed and listed as follows :

1. It may be difficult to map data in precise form automatically. For example mapping the sentence to CG form automatically can be done by using parsing technique to analyze the structure of the sentence and then map them to CG. The mapping from sentence to CG could be done automatically if an extensive knowledge base is used.
2. In practice, the number of temporal relations can be reduced to three main temporal relations with the following modifications:
 - 2.1 BEFORE(X,Y) if $ET(X) \leq BT(Y)$. In this case the meet relation can be considered as a special case of before where $ET(X) = BT(Y)$.
 - 2.2 DURING(X,Y) if $BT(Y) \leq BT(X) \leq ET(X) \leq ET(Y)$ then EQUAL(X,Y) is a special case of during where $BT(Y) = BT(X) \leq ET(X) = ET(Y)$.
 - 2.3 OVERLAP(X,Y) if $BT(X) \leq BT(Y) \leq ET(X) \leq ET(Y)$ then FINISH(X,Y) is a special case of overlap where $ET(X) = ET(Y)$; and START(X,Y) is also a special case of overlap where $BT(X) = ET(Y)$.

Other six inverse relations can be represented by arranging the order of parameters, for example, AFTER(X,Y) \equiv BEFORE(X,Y). Such extension helps to reduce the number of rules for inferring the temporal knowledge enormously.
