

## **ABSTRACT**

This Obstetrics Information System Project is developed to improve the functions of the Obstetrics Department in Vajira Hospital from manual system to computerized system and helps the hospital in achieving greater operational efficiency and control of information oriented tasks in administrative and patient care areas. The structured analysis and design technique is applied in developing the Obstetrics Information System which is implemented on a Local Area Network (LAN) System. With this new system, data are kept in a computerized filing system which can reduce some workload, processing time, and are more easily accessed and retrieved. Activities in the project includes the development of flows of data, document, reports, and also inputs and outputs screen and files.
