Acknowledgements

The author would like to sincerely thank my project advisor Dr. Waralee Watcharin for always offering me the continuous, graciousness and wholehearted support with her consult and recommendations that totally help me to complete this project successfully.

Besides, I would like to thank the rest of my thesis committee: Dr. Tatsawan Tipvarakankool and A. Sireerat Laodheerasiri on their encouragement, insightful comments and the recommendations from my fault to be completely improved.

My sincere thanks also go to my family, for supporting and giving me good recommendations throughout my life.

Last but not least, I would kindly like to thank technicians for helping me during my lab sessions, my friends Miss Sutida Ngernpium for always helping me during lab sessions and being with me when I did my lab at late night, Mr. Nadthanun Junpratug for helping me to teach analyzing the statistical data by R statistical program, and Miss Patthakorn Manupeerapan for always giving me the encouragement and recommendations through my project.

Thank you,

Ms. Yatinun Na Songkhla

Abstract

The kappa carrageenan polysaccharide can be extracted from red edible seaweeds which has an ability to form gel. Carrageenan-based hydrogels containing grape seed extract were prepared with 9 formulations: 0.5%, 1% and 2% grape seed extract with various concentrations of glycerol (0%, 12.5%, and 25%). The physical properties of carrageenan-based hydrogels were analyzed i.e. color measurement, moisture content, swelling properties, degradation, firmness. In addition, the antioxidant properties of carrageenan-based hydrogels were studied as total phenolic content and % scavenging activity. Among 9 formulations, the results reported their percentages of opacity were 99-100%, moisture contents were 9-12%, swelling properties were 14-29%, degradations were 20-72%, and firmness were 10-55%, respectively. The high firmness and high resistance to degradation were found in 3 formulations containing 25% glycerol and 0.5%, 1% and 2% grape seed extract. For antioxidant activities, the results showed the highest total phenolic content at 23.3 ± 1.0 mg GAE/mL and scavenging activity (%) at $87.8 \pm 1.6\%$ in formula containing 25% glycerol and 2% grape seed extract. The results suggested that grape seed extract was useful in the prevention of diseases in which free radicals implicated.

Key words: hydrogels, carrageenan, grape seed extract, antioxidant activity

Introduction

Hydrogel is a three-dimensional (3D) network of hydrophilic polymers which can highly swell in water and absorb large amount of water while maintaining the structure due to chemical or physical cross-linking of individual polymer chains. Hydrogels were first reported by Wichterle and Lím (1960) [1]. By definition, water must constitute at least 10% of the total weight (or volume) for a material to be a hydrogel. Hydrogels also possess a degree of flexibility very similar to natural tissue due to their significant water content. The hydrophilicity of the network is due to the presence of hydrophilic groups such as $-NH_2$, $-COOH$, $-OH$, $-CONH_2$, $-CONH-$, and $-SO_3H$ [2]. For most medical application, the novel engineering of hydrogels for drug delivery require dividing them to biodegradable hydrogels which are favoured over non-degradable hydrogels since they degrade in clinically relevant time scale [3], smart hydrogel or stimuli-sensitive hydrogel that respond to environmental changes, such as temperature, pH, light, and specific molecules such as glucose [4] and finally biomimetic hydrogels which are relatively inert polymer chains can be tailored with the selected biological moieties to yield bioactive hydrogels [5].

In this project, carrageenan is polymer used for preparing hydrogels. Carrageenans correspond to a family of hydrophilic polysaccharides consisting of linear and highly sulfated galactans found in several marine red algae species (class of Rhodophyceae) composed by repeating 3,6-anhydro-D-galactose and b-D-galactose-4-sulfated units [6]. The three main types of carrageenans include the kappa (κ -), with one sulfate group, iota (ι -) and lambda (λ -) with two and three sulfate groups, respectively [7]. These natural polymers are widely used in several industrial, environmental, and commercial applications as gelling, thickening, emulsifying, and stabilizing agents due to their ability to form thermo-reversible gels and viscous solutions [8]. More recently, carrageenan hydrogels started to be explored in regenerative medicine as scaffolds and controlled-release systems for ophthalmic/oral drug preparations, growth factors, enzyme immobilization, and cell encapsulation [9]. Several bioactive agents are used in this study (i.e. grape seed extract, hyaluronic acid) as well as other pharmaceutical and cosmetic ingredients such as allantoin, glycerol, sorbitol and collagen.

Grape seed extract is an industrial derivative of whole grape seeds. The extract contains proanthocyanidins [10]. Grape seed extract quality is measured by the content of procyanidins which are formed from proanthocyanidins. Generally, grape seed extract quality contains 95% procyanidins, but potency varies among products [11]. Grape seed extract is an industrial derivative of grape seeds. It is rich in antioxidants and oligomeric proanthocyanidin complexes and has been linked to a wide range of possible health benefit. treating tooth decay, protecting against pathogens, improving night vision, Alzheimer's disease, treating diabetic retinopathy and improving blood sugar control, relieving symptoms of chronic venous insufficiency, anti-aging properties (protecting collagen and elastin), reducing edema, relieving symptoms of chronic venous insufficiency, reducing iron levels in people with hemochromatosis, and reducing inflammation [12].

Sorbitol is a sugar alcohol found in fruits and plants with diuretic, laxative and cathartic property. Unabsorbed sorbitol retains water in the large intestine through osmotic pressure thereby stimulating peristalsis of the intestine and exerting its

diuretic, laxative and cathartic effect. In addition, sorbitol has one-third fewer calories and 60 % the sweetening activity of sucrose and is used as a sugar replacement in diabetes [13].

Glycerin is a trihydroxyalcohol with localized osmotic diuretic and laxative effects. Glycerin elevates the blood plasma osmolality thereby extracting water from tissues into interstitial fluid and plasma. This agent also prevents water reabsorption in the proximal tubule in the kidney leading to an increase in water and sodium excretion and a reduction in blood volume. Administered rectally, glycerin exerts a hyperosmotic laxative effect by attracting water into the rectum, thereby relieving constipation. In addition, glycerin is used as a solvent, humectant and vehicle in various pharmaceutical preparations [14]. Glycerin is used safely in numerous cosmetics and personal care products such as soaps, toothpaste, shaving cream, and skin/hair care products to provide smoothness and lubrication. It is also a well-known humectant that prevents the loss of moisture from products so they don't dry out as quickly. Other reported functions for glycerin include use as a fragrance ingredient, denaturant, hair conditioning agent, oral care agent, skin conditioning agent— humectant, skin protectant, oral health care drug, and viscosity decreasing agent [15].

Collagen is a hard, insoluble, and fibrous protein that makes up one-third of the protein in the human body. In most collagens, the molecules are packed together to form long, thin fibrils. These act as supporting structures and anchor cells to each other. They give the skin strength and elasticity. There are at least 16 different types of collagen, but 80 to 90 percent of them belong to types 1, 2, and 3. These different types have different structures and functions. The collagens in the human body are strong and flexible. Collagen is resorbable. This means it can be broken down, converted, and absorbed back into the body. It can also be formed into compacted solids or lattice-like gels [16]. Its diverse range of functions and the fact that it is naturally occurring make it clinically versatile and suitable for various medical purposes. Collagen for medical use can originate from humans, cows, pigs, or sheep. Skin fillers, collagen injections can improve the contours of the skin and fill out depressions. Fillers that contain collagen can be used cosmetically to remove lines and wrinkles from the face. It can also improve scars, as long as these do not have a sharp edge. These fillers are sourced from humans and cows. Skin tests should be done before using collagen from cows, to avoid aggravating any allergies. Collagen can fill relatively superficial volumes. More extensive gaps are usually filled with substances such as fat, silicone, or implants. Wound dressing, collagen can help heal wounds by attracting new skin cells to the wound site. It promotes healing and provides a platform for new tissue growth. Collagen dressings can help heal: chronic wounds that do not respond to other treatment, wounds that expel bodily fluids such as urine or sweat, granulating wounds, on which different tissue grows, necrotic or rotting wounds, partial and full-thickness wounds, second-degree burns, and sites of skin donation and skin grafts. Guided tissue regeneration, collagen-based membranes have been used in periodontal and implant therapy to promote the growth of specific types of cell. In oral surgery, collagen barriers can prevent fast-growing cells around the gum from migrating to a wound in a tooth. This preserves a space where tooth cells have the chance to regenerate. Collagen-based membranes can aid healing in these cases and they are resorbable, so this barrier does not need to be surgically removed after the main operation [17].

Hyaluronic acid or HA is a non-sulphated GAG and is composed of repeating polymeric disaccharides of D-glucuronic acid and N-acetyl-D-glucosamine linked by a glucuronic β (1 \rightarrow 3) bond [18]. In aqueous solutions HA forms specific and stable tertiary structures. Despite the simplicity in its composition, without variations in its sugar composition or without branching points, HA has a variety of physicochemical properties. HA polymers occur in a vast number of configurations and shapes, depending on their size, salt concentration, pH, and associated cations [19]. Unlike other GAG, HA is not covalently attached to a protein core, but it may form aggregates with proteoglycans. HA encompasses a large volume of water giving solutions high viscosity, even at low concentrations [20].

Allantoin is a skin active ingredient with keratolytic, moisturizing, soothing, anti-irritant properties, promotes the renewal of epidermal cell and accelerates wounds healing. Allantoin is safe and non-irritant, highly compatible with the skin and with cosmetic raw materials. Allantoin enjoys a long history of use in cosmetics and topical pharmaceuticals with no findings of toxicity or adverse reactions. Comply with CTFA and JSCI requirements [21]. The beneficial effects on the skin of Allantoin were well documented. Allantoin is a mild keratolytic agent that dissolves the intercellular cement that holds the cornified cells together, helping the natural desquamation of stratum corneum and increasing skin smoothness. The moisturizing effect results from its ability to increase the water bounded to the intercellular matrix and keratin, thereby softening skin and making the skin look healthier. The soothing, anti-irritant and skin protectant effect is due to the ability of Allantoin to form complexes and neutralize many irritant and sensitizing agents. Allantoin enhances epidermal cell-proliferation, promotes the regeneration of damaged epithelium and accelerates wound healing [22]. Moreover, allantoin is suitable for any personal care application. Its use notably increases the performance of every cosmetic preparation: used at low levels on intact skin gives a smooth and healthy appearance; used on irritated, chapped and cracked skin provide relief from pain and promote healing. Allantoin is also useful as only active ingredient. The many cosmetic applications include: Body and face care, Hand-care: gels, lotions, creams, Shaving-care: shaving soaps, aftershaves, gels, lotions, creams, Baby-care: diaper rash, bath products, gels, lotions, creams, powders, wipes, Lips-care: sticks, creams, Sun-care: sunscreens, aftersuns, suntans, gels, lotions, creams, Hair products: shampoos, tonics, Bath products: shower gels, bubble baths, intimate, powders, wipes, Oral preparations: toothpastes, mouthwashes [23].

Objectives

1. To develop the formulation of carrageenan-based hydrogel containing grape seed extract.
2. To investigate the physical properties of the prepared carrageenan-based hydrogel.
3. To determine radical scavenging properties of the prepared carrageenan-based hydrogel.

Materials and Methods

1. Materials

Carrageenan was purchased from Chemipan (Thailand), sorbitol from Sigma Aldrich, and glycerin from Lab Valley (Thailand). Substances used were vitamin c, collagen, grape seed extract, hyaluronic acid and allantoin (Chemipan, Thailand). The laboratory grade reagents used in the preparation of PBS buffer solution were as follows: NaCl, KCl, $\text{Na}_2\text{HPO}_4 \cdot 12\text{H}_2\text{O}$ and KH_2PO_4 .

Equipments

1. Hot Air Oven
2. Color measurement, Hunter Lab CIEL*a*b*
3. Texture analysis, TA.XTpulsC Texture analyser
4. Shaking incubator
5. Spectrophotometer

2. Methods

2.1 Preparation of hydrogels

In the first step, carrageenan solutions (2% w/v), sorbitol solutions (5% w/v) were prepared, then mixed with glycerol and water following each formulae, in order to obtain the final volume of 100 mL solution. According to each of formulae, grape seed extract was continually added. Afterwards, small amount of ingredients are as follows: vitamin c, collagen, hyaluronic acid (HA) and allantoin (AL) were added to each of formulae. After mixing all ingredients, heated to 60-70°C for 30 minutes, then poured in the semi-circle silicone molds with 2.8 cm diameter and 1.7 cm height. In the final step, the solutions were cooled at 4°C for a day. The composition of each of formulae to prepare hydrogels is shown in Table 1.

Table1. The composition of mixtures to prepare hydrogels

Sample no.	2% w/v Carrageenan (mL)	5% w/v Sorbitol (mL)	Glycerol (mL)	Water (mL)	Vitamin C (g)	Grape Seed Extract (mL)	Collagen (g)	HA (g)	AL (g)
F81	50	25	-	25	0.1	0.5	0.2	0.2	0.5
F82	50	25	-	25	0.1	1	0.2	0.2	0.5

F111	50	25	12.5	12.5	0.1	0.5	0.2	0.2	0.5
F112	50	25	12.5	12.5	0.1	1	0.2	0.2	0.5
F113	50	25	12.5	12.5	0.1	2	0.2	0.2	0.5
F121	50	25	25	-	0.1	0.5	0.2	0.2	0.5
F122	50	25	25	-	0.1	1	0.2	0.2	0.5
F123	50	25	25	-	0.1	2	0.2	0.2	0.5

2.2. Moisture content properties

Hydrogel samples with a diameter of 2.8 cm and a height of 1.7 cm were weighed and taken in the hot air-drying oven at 60°C for 2 hours. The weight of each samples was weighed after taking out from the oven. The moisture content (% M) was calculated according to the following formula:

$$\text{Moisture Content (\%)} = \frac{W_i - W_d}{W_i} \times 100$$

Where W_i represents the initial weight of sample, and W_d corresponds to the weight of sample after drying. The test samples were completely done in triplicate for each.

2.3. Swelling properties

As a function of swelling time, temperature and pH, swelling capacity of hydrogel in PBS buffer (pH 7.4) at 37°C, distilled water (pH 5.5) at 37°C, PBS buffer (pH 7.4) at 25°C and distilled water (pH 5.5) at 25°C were determined. 5g of the sample was immersed in 40 ml each of condition.

This experimental part was performed by placing hydrogel samples with a diameter of 2.8 cm and a height of 1.7 cm in each condition. At each time intervals; 0, 2, 4, 6, and 24 h, swollen gels were taken out from the swelling medium, and dried to remove the excess from the surface by using filter paper. The degree of swelling (% S) can be calculated by using the below equation:

$$\text{Degree of swelling (\%)} = \frac{W_s - W_d}{W_d} \times 100$$

Where W_s is the weight of swollen sample at t time, and W_d is the weight of initial sample at 0 time. The test samples were completely done in triplicate for each.

2.4. Mechanical strength properties

Semi-circle samples with a diameter of 2.8 cm and a height of 1.7 cm were used for mechanical test using texture analyzer. Compression platen probe with 100 mm diameter was used to analyze the firmness, test speed is 20 mm/sec and target distance is 5 mm. The result was obtained from the raw data and force (N) was plotted.

2.5. Color Measurement

CIE whiteness, brightness, $L^*a^*b^*$ color and opacity of the gels were measured with Hunter Lab CIE $L^*a^*b^*$ system colorimeter. The followings are the ways that were used to measure samples in this measurement: covering with white ceramic plate, and covering with white ceramic plate and the black cover. Opacity (%) O) is a measure for the transparency of hydrogels can be calculated by using the following equation:

$$\text{Opacity (\%)} = \frac{R_{wb}}{R_w} \times 100$$

Where R_{wb} refers to reflectance of a sample sheet over perfect black, and R_w refers to reflectivity of the same sample over perfect white. The test samples were completely done in triplicate for each.

2.6. In vitro degradation properties

The enzymatic degradation behavior of the carrageenan-based hydrogels was performed by immersing 5 g of hydrogel into PBS buffer (pH 7.4) and distilled water (pH 5.5) and incubated them in a shaking incubator with 50 rpm for 24 hours. After 4 hours passed, the gels were taken out and weighed (w_t). The weight loss (% W) was calculated by using the below equation:

$$\text{Weight loss (\%)} = \frac{W_0 - W_t}{W_0} \times 100$$

Where W_0 is the initial weight of each sample, and W_t is the weight of sample at each time intervals. The test samples were completely done in triplicate for each.

2.7. Total phenolic compounds

Folin-Ciocalteu (FC) method was used to determine the total phenolic compounds of carrageenan-based hydrogel. 0.1 ml of carrageenan-based hydrogel released solution which is obtained from degradation test, was mixed with 1.25 mL of 0.1 N FC reagent solution, and vortexed immediately. After 4 minutes, 1 ml of 0.7 M Na_2CO_3 was added to the mixture. Afterwards, the mixture was totally shaken and left

to incubate at room temperature for 1 hour. In the final step, UV-Vis spectroscopy at 760 nm was used to measure the absorbance of the solution. Gallic acid was used as the standard curve for determining the phenol content. Results were reported in the gallic acid equivalents and the total phenols were expressed as milligram gallic acid equivalents per mL (mgGAE/mL). The test samples were completely done in triplicate for each.

2.8. DPPH free radical scavenging activity

The DPPH free radical scavenging activity was determined using the method proposed by Brand-Williams. The test samples were compared to a known antioxidant, ascorbic acid (1000 ppm). 0.3 ml of DPPH solution (0.1 mM, in methanol) was mixed with 3ml of methanol and 0.5 ml carrageenan-based hydrogel release solutions at different pH solutions; pH 5.5 and pH 7.4 which obtained from degradation test. After mixing, the samples were kept for 1 hour at room temperature in the dark. The DPPH radical was determined by measuring the absorbance at 517 nm via UV-Vis spectroscopy. Methanol was used as blank, and 3ml of methanol mixed with 0.3 ml of DPPH was used as control. The test samples were completely done in triplicate for each.

$$\text{Inhibition (\%)} = \frac{\text{Abs control} - \text{Abs sample}}{\text{Abs control}} \times 100$$

Where Abs_{control} is absorbance of methanol and DPPH solution (10:1)

Abs_{sample} is absorbance of sample in methanol and DPPH solution (10:1)

2.9 Shape retention and microbial growth studies

Hydrogel samples with a diameter of 2.8 cm and a height of 1.7 cm were placed into petri dishes and left at room temperature to observe the shape retention and microbial growth at 1, 5 and 7 days, respectively.

Results and discussions

1. Moisture content properties

Moisture Content was determined at hot air oven 60°C for 2 hours, As shown in figure1, F121, F122, and F123 formulae showed the higher moisture content (%) than the others. These formulae contain the highest 25% glycerol, this can be explained that glycerol acts as moisturizing agent which this moisturizing agent has high ability to absorb water from the surroundings that could effect on its evaporating from the deeper layers of the hydrogels, an effect known as trans-epidermal water loss (TEWL) [24]. Thus, when glycerol evaporated and released from the hydrogels increased, it means that moisture content (%) increased as well. While F81, F82 and F83 formulae contain no glycerol showed the lower moisture content (%) among the rest, this can be illustrated that there is no glycerol which acts as moisturizing agent to be evaporated and released from the deeper layers of the hydrogels.

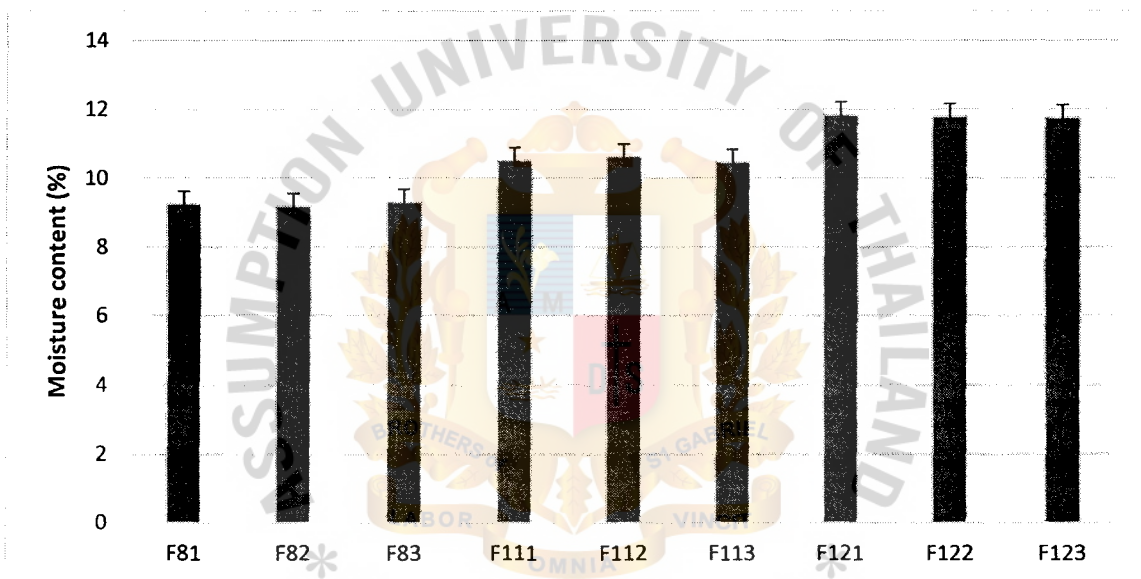

Figure1. Moisture content (%) of carrageenan-based hydrogels

2. Swelling Properties

2.1 Effect of temperature on the swelling capacity

Effect of temperature on percent swelling was determined at two different temperature (RT and 37°C). It was found that both pH conditions, the degree of swelling rose with the increase of temperature, this could be explained that at the temperature at 37°C the rate of water penetration inside the polymeric network was greater than the rate of penetration at RT. Furthermore, water molecules form hydrogen bonds with hydrophilic groups of the candidate polymer leading to the stable shell of hydration around these hydrophilic groups and resulting in the greater absorption of water and making the increase of percent swelling [25].

Figure2. Effect of temperature at 37°C and RT on the swelling capacity of carrageenan-based hydrogels in distilled water (pH 5.5)

2.2 Effect of pH at 37°C on the swelling capacity

Effect of temperature on percent swelling was studied at two different pH intervals (pH 5.5 and pH 7.4). After 24 hours, the swelling behavior was clearly observed. Hydrogel samples in pH 7.4 were very differently from those in pH 5.5 as shown in the Figure3. In pH 7.4, water molecules highly forms hydrogen-bonding so they generate more space for the molecules to penetrate inside [26], thus swells more, and hydrogel is sensitive to basic pH conditions that makes absorbing more basic liquids [27]. Both pH conditions, F121, F122 and F123 (25% glycerol) showed the maximum degree of swelling among the rest, this can be explained that their main composition consisted of the same amount of carrageenan and sorbitol, however it contained higher amount of glycerol (25% glycerol or glycerol:water as 2:0). Glycerol is a hydroscopic so it has a higher ability to absorb water than sorbitol, thus swells more than the other formulae [28].

Figure3. Effect of pH at 37°C on the swelling capacity of carrageenan-based hydrogels in distilled water (pH 5.5) and PBS buffer (pH 7.4)

2.3 Effect of pH at room temperature on the swelling capacity

Effect of pH at room temperature on percent swelling was investigated in two different pH (pH 5.5 and pH 7.4). After 24 hours, the swelling capacity could be obviously seen that hydrogels sample in pH 7.4 were significantly different from samples in pH 5.5 as shown in Figure 4. This can be explained that in pH 7.4, water molecules undergo hydrogen-bonding forms so generates more space which results in swelling more. Also, hydrogel is sensitive to basic pH that makes absorbing more basic liquids [29]. Both pH conditions, F121, F122 and F123 reached the highest degree of swelling capacity among the others, due to glycerol which is a hydroscopic so it has a higher ability to absorb water than sorbitol, thus swells more than the other formulae [30].

Figure4. Effect of pH at RT on the swelling capacity of carrageenan-based hydrogels in distilled water (pH 5.5) and PBS buffer (pH 7.4)

3. Texture Compression Analysis

Hydrogel firmness is used as the quality evaluation for texture parameter. Texture analyses were performed using a probe that compressed on the prepared samples, with a defined force, the result of force was plotted. The hydrogel composition influences its compression analysis. Figure 5 represents the obtained result of firmness from textural analysis. According to the obtained result, it can be seen that F81, F82, F83 exhibited the lowest compression force, and F121, F122, and F123 exhibited the highest compression force comparing to the others. Carrageenan-based hydrogels with higher water content firmed at a slower rate than hydrogels with the lower water content. Besides, it was found that the application of glycerol caused changes in the mechanical properties of carrageenan-based hydrogels as well. By increasing the amount of glycerol, the firmness values of all of the samples increased due to the tightly cross-linking of glycerol polymers [31].

Figure5. Firmness force of carrageenan-based hydrogels

4. Color measurement

For color measurement, the results showed as L*, a*, b*, and opacity (%). According to the table2, it can be seen that percent opacity of all prepared hydrogels were quite similar from 98-100 percent. Moreover, when b* value increased, making percent opacity increased as well, this can be explained that positive b* interpreted the yellow color which means when grape seed extract increased, it affected to b* values. Therefore, F83, F113, F123 formulae which contain 2% grape seed extract showed the highest percent opacity thus, the color of carrageenan-based hydrogels were obviously affected by grape seed extract concentration.

Sample no.	L*	a*	b*	% Opacity
F81	33.38 ± 0.24	-1.05 ± 0.05	5.27 ± 0.28	99.95 ± 0.47
F82	33.38 ± 0.66	0.17 ± 0.08	8.34 ± 0.25	99.45±0.20
F83	30.58 ± 0.48	1.25 ± 0.13	11.15±0.58	99.97 ± 0.37
F111	34.52 ± 1.18	-0.49 ± 0.11	6.62±0.66	98.71 ± 0.32
F112	33.40 ± 1.61	0.23±0.24	10.29±1.01	99.52 ± 0.48
F113	30.58 ± 0.82	1.47±0.13	13.66±0.14	99.08 ± 0.53
F121	36.47 ± 0.58	-0.69±0.12	-0.69±0.37	99.78 ± 0.56
F122	31.33 ± 1.03	0.40±0.04	9.99±0.65	100.04 ± 0.81
F123	27.55±0.68	1.90±0.10	11.61±0.08	99.94±0.15

Table2. Color measurement as L*, a*, b*, and opacity (%) of carrageenan-based hydrogels

5. Antioxidant activities

5.1 Total phenolic compounds and DPPH assay

The antioxidant properties of the prepared hydrogels were determined from the degraded hydrogel solution after degrading 24 hours in PBS buffer (pH 7.4) and distilled water (pH 5.5) using total phenolic compound test and DPPH assay. Herein, total phenolic content of degraded solution was determined by the Folin-Ciocalteu colorimetric method and gallic acid was used as a standard phenolic compound. The content of total phenols is expressed as gallic acid equivalents (mg GAE/mL). As the figure6 shown, all carrageenan-based hydrogels degraded in pH 7.4 exhibited higher total phenolic compounds than that of pH 5.5 medium. At pH 5.5, the prepared hydrogel released grape seed extract molecules more effective than pH 7.4 resulting from the further hydrolysis of carrageenan hydrogels in acidic medium. At the same pH condition, the carrageenan-based hydrogels containing grape seed extract 2% has higher total phenolic content in comparison with the prepared hydrogels containing grape seed extract 0.5% and 1%. There was significant difference between the total phenolic content of prepared hydrogels containing grape seed extract 0.5%, 1% and 2% at each storage condition. The grape seed extract could act as antioxidant agent, and it was indicated that high total phenolic content was observed in the samples which contain phenolic compounds in high amounts [32].

Figure6. Total phenolic content of carrageenan-based hydrogels in distilled water (pH5.5) and PBS buffer (pH 7.4)

For antioxidant properties, scavenging activity of carrageenan-based hydrogel containing grape seed extract was observed using DPPH assay. DPPH free radicals have ability to receive electron or bind with hydrogen from antioxidant molecules becoming a stable molecule. The decrease of DPPH radical quantity resulted in discoloration originally from purple to yellow. Degree of discoloration depended on radical scavenging activity of antioxidant compound in samples. Because the antioxidant activity was influenced by pH, and antioxidant activity could depend upon the oxidation rate of antioxidant compounds, and this oxidation rate was influenced by the surrounding pH [33].

As figure 7 shown, the prepared hydrogels had greater antioxidant properties at pH 5.5 medium than pH 7.4 medium. In acidic media (pH 5.5), the prepared hydrogel released degrading molecules more effective than pH 7.4 as observed in the previous results. At the same pH condition, the carrageenan-based hydrogels containing grape seed extract 2% had considerably higher scavenging activity in comparison with the prepared hydrogels containing grape seed extract 0.5% and 1% as it contained the higher amount of antioxidant agent. There was significant difference between scavenging activity of prepared hydrogels containing grape seed extract 0.5%, 1% and 2% at each storage condition. From these results, it can be seen that both the ratio of grape seed extract and the different pH conditions could impact the antioxidant properties including total phenolic content and scavenging activity.

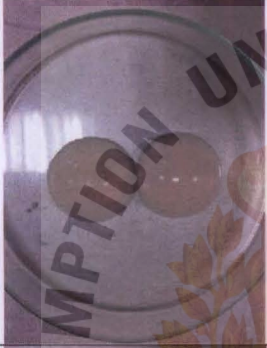

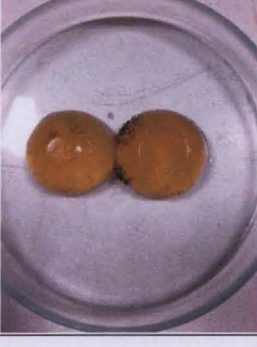

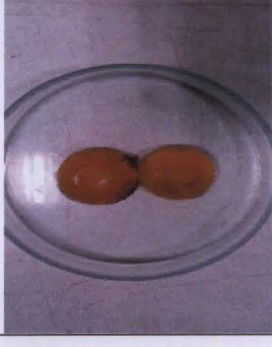

Figure7. Radical scavenging activity (%) of carrageenan-based hydrogels in distilled water (pH5.5) and PBS buffer (pH 7.4)

6. Shape retention and microbial growth

According to the figure8, F121, F122, and F123 demonstrated no microbial growth on the surface of hydrogels after keeping at room temperature for 7 days. This can be explained that these formulae contained the highest percentages of glycerol (25% from the total volume). As glycerol property, it could bind to adjacent water molecules with hydrogen bonds. When water molecules were bound, water molecules were not free and not released as the free water content to microbes. Thus, this was resulted from low water activity as the above supporting reasons.

Conclusions

According to the overall results, they can be concluded as followings: First, carrageenan-based hydrogels were successfully prepared for 9 different formulae; 0.5%, 1% and 2% grape seed extract with various ratio of glycerol and water. Second, the results obtained that formulae F121, F122 and F123 (with 25% glycerol containing grape seed extract 0.5%, 1% and 2%) showed the higher firmness, higher resistance to degradation, and no microbial growth after storage for 7 days, comparable to all formulae. Finally, comparing formulae F121, F122 and F123, F123 showed the highest total phenolic content and % scavenging activity. Thus, the most optimum formula of carrageenan-based hydrogels was F123 containing 25% glycerol and 2% grape seed extract. Grape seed extract exhibited high antioxidant activities in carrageenan-based hydrogels which could enhance the repair and healing of cells and tissues in chronic wounds, and prevent oxidative damage.

Appendix I : PBS buffer preparation (1 liter)

Step no.	Added chemicals
1.	Start with 800 mL of distilled water.
2.	Add 8 grams of NaCl
3.	Add 0.2 gram of KCl
4.	Add 1.44 grams of Na ₂ HPO ₄
5.	Add 0.24 gram of KH ₂ PO ₄
6.	Adjust pH to 7.4 with HCl
7.	Add distilled water to a total volume of 1 liter.

Appendix J: DPPH solution 0.1 mM, 100 mL

From DPPH *M.W.* = 394.33 g/mol, % Assay = 85 %

$$\begin{aligned}
 &\text{Solution 1000 mL} \quad \text{have DPPH} \quad 0.1 \text{ mmol} \\
 &\text{Solution 100 mL} \quad \text{have DPPH} \quad \frac{100 \text{ mL} \times 0.1 \text{ mmol}}{1000 \text{ mL}} \\
 &= 0.00001 \text{ mol}
 \end{aligned}$$

M.W. = 394.33 g/mol

$$\begin{aligned}
 &\text{DPPH 1 mol} \quad \text{mass} \quad 394.33 \text{ g} \\
 &\text{DPPH 0.00001 mol} \quad \text{mass} \quad \frac{(0.00001 \text{ mol}) \times 394.33 \text{ g}}{1 \text{ mol}} \\
 &= 0.0039433 \text{ g}
 \end{aligned}$$

% Assay = 85

$$\begin{aligned}
 &\text{DPPH 85 g} \quad \text{from the chemical} \quad 100 \text{ g} \\
 &\text{DPPH 0.0039433 g} \quad \text{from the chemical} \quad \frac{0.0039433 \text{ g} \times 100 \text{ g}}{85 \text{ g}}
 \end{aligned}$$

$$= 0.004639 \text{ g}$$
