ABSTRACT

This System Development Project provides the analysis,design,and implementation of Fixed Asset Information for a part manufacturing company. The analysis and design process cover the problem definitions,study plan,information gathering and understanding of the existing system and the new requirements. It also includes the design of the new system to solve or minimize the problems. The new system can help to reduce the operating costs and time consuming.

The scope of the project concerns with the recording of fixed asset information,recording all transaction activities,calculating the depreciation and also creating the several kinds of reports for internal Accounting Department.

The new system is designed on PC LAN network system that support the other proposed Accounting Information System to share the database for encouraging the accounting operations and controlling of Management.
