ABSTRACT

The project is to create an inventory system software to improve inventory system of the company to be standardize and be more efficient.

The current information system of S.N. Cooling Co. uses manual work when purchasing new product, they will record the number of product that they buy in the inventory system which has no efficiency. They use a long time to update or recall the stock.

Nowadays the company has large amount of paper work to record as important database but the paper is the material that is difficult to maintain. This project will highlight these problem with proper solution suggested.

With this proposed system which is based on Visual Basic, all information can be stored in Microsoft Access which requires less time and staff. Moreover, the data will be more stabilized and easier to retrieved. Similarly, the inventory system is computerized. Calculating errors would be diminished by the automatic calculation provided by the system.
