

ABSTRACT

This project covers an analysis, design and development of the Accounts Payable System for telecommunications company, which is one of the world leading in Telecom Network.

The analysis and design phases cover the problem definition, study plan information gathered and understanding of a current system and new system requirements. It also includes new system design and economic cost comparison.

The new Accounts Payable System is intended to provide an overall control of data reports for management use in a timely manner. The system also reduces peak workload and manpower expenses caused by manual preparation of payments.

The critical success factor in this development is not the best computer system design and programming part, but the suitable procedure which is the skeleton of the system.
