Abstract

In the following project we will present a comparison between two systems. The one currently at use in our faculty and the new now we are proposing.

The current VMS Senior Project system covers the basic processes of senior project registration, topic selection and topic assignment, as well as grading. It is however still limited in terms of input/output accuracy, raw layout and data presentation, data ease of access, etc.

The system we are proposing should then be the improved version of the current one. It should be capable of efficiently using data input from all the processes, offering a cleaner information visualization, gathering basic data from scattered process, etc.

Both the current and the proposed system deal with 3 users: the student, the advisor and the administrator.
